>
>If I am stationary, my position should be sent LESS often, i.e. once an
>hour or maybe once every half hour.. (my opinion is once an hour). Now
>when someone starts up and querries the network, I can send my position
>so I show up on their map..

I see the problem, but I don't think it's solved so easily.

On VHF, if the net is sparse, there's little need to conserve bandwidth.
Also, few stations querying.
If the net is dense, where more bandwidth needs to be conserved, then you
have more stations querying. The thing that you're using to throttle your
bandwidth has the wrong slope.

The problem is that unless you send your position with the data, you have
no way of knowing if the clients know where you are.

>Now, If I am transmitting weather EVERY 5 MINUTES (like a lot of the
>weather people want), then I am transmitting my position 6 to 12 times
>MORE than I need to..

Assuming you're fixed. Of course a lot of the weather data is redundant
as well. It may be that the temperature hasn't changed in an hour.

On HF, where the bandwidth considerations force the issue, it seems
reasonable to assume fixed stations. I'm not sure if a moving weather
station makes sense at all in an HF context.

You might further conserve bandwidth by only sending the changed parameters.

> >Now, If I am transmitting weather EVERY 5 MINUTES (like a lot of the
> >weather people want), then I am transmitting my position 6 to 12 times
> >MORE than I need to..

APRSdos has always used "smart beaconing" for WX just like all other
packets. If the data is new, then it sends it 5 minutes later. If none
of the parameters have changed, then the packet is like any other APRSdos
packet, the time to the next packet is decayed by 50%. That is it will be
7 minutes later. If there is still no change, then the next one will be
10 minutes later, etc... up to a maximum of the net-cycle time...

But if there is anything happening, like rain, or a front passing through,
or a change of wind speed by a reasonable amount, then the WX report is
sent immediately and the decay timer is reset to 5 minutes.. Think of it
as "smart-beaconing" for weather...

Thus, when you need it, it is frequent. When it is boring, it decays...to
longer time periods.. To make this work, I had to make brackets for Wind

speed and direction... because they are always changing some..

>"OK" for anyone else to send them. Maybe a more accurate statement might
>be "That's the way the Sproul's wrote their software ... so position-less
>packets are a fact of life."
>
It wasn't just "the way the Sproul's wrote their software". This was something that was discussed extensively among the developers, and while Bob may have had his reservations about this, he did agree to it.

The issue here was saving bandwidth, you do not need to send a position with every weather report. It was not a mistake, or one developer working alone, but a considered decision of the group.

If you are moving, you have the option of using software which includes the position in the weather packet. However, being real, I'd bet less that 0.01% of weather reports are in a different location than the previous report from that station. Is it worth 1000 unnecessary positions to cover this rare event?

As to time stamps, from a network perspective these are worthless. So few stations have their clocks set correctly that to try to extract data from these results in decreasing the correctness of the time...findU ignores all timestamps and just uses the time the data was received.

Rendered body type: text/plain

I had a solar powered one up on a hill inside a homemade plywood enclosure that looked like an oversize birdhouse. The top, and all 4 vertical sides were covered with asphalt shingles. I had a whole pkg of the starter
course
shingles in the garage left over.The front piece was removable w/3 drywall screws. Survived 54 MPH wind Nor'Easters with no rain leakage. I used this thing for 4 years!

I have lately found metal encloseures in the dump (recycling yard) that are sealed w/wx stripping when closed. Temporary service entrances use these when supplying power while building a house.
Now I built a 12'x8' shed an put up a 70' tower and have the APRS WX Digi and the local 2M repeater in there.... all of which solar powered.

The clock built into the Ultimeter, for example, gains a minute or more
per week. A standalone weather station may be transmitting a terribly
incorrect time.

I use the weather station's timestamp as a heartbeat. It is useful for
this. It proves the station is writing data to the buffers. For
measuring time it's almost worthless unless you reset the clock daily.

Of course, but system-wide, very few people do this. To convice yourself, just
grab a minute of stream data and see what wildly varying times you get. There is
no way for a client to identify which time stamps can be trusted and which
can't. APRS is a real time system, data is transmitted within seconds of being
valid, so a supposition that the time is now is not unreasonable, certainly more
so that trusting time stamps. That makes your efforts at time-keeping moot,
because most client authors have discovered that the best way to handle the

timestamps is to ignore them.

My god! How long do you keep position data in the findu database?? I just
tried the new cgi by copying and pasting the line above into my browser, and
then editing it to substitute my call .   I didn't notice your argument for
7200 hours, and expected to see just today's out-and-about Los Angeles
driving.

Instead, I was startled to see a trip I made to Prescot/Sedona/Flagstaff AZ
in early March and a trip from L.A. to northern CA in late Feb, along with a
dense blob in Southern California from weeks of everyday trips around L.A.

Ray - WB3ABN responds:

1) Few weather stations will have GPS installed, let alone configured to update system clocks by GPS. Exceptions may be "mobile" weather stations, which are a completely different animal and have their own set of problems (regarding validity of data derived from moving sensors)

2) If a weather station operator cannot be relied upon to time stamp a data packet with a reasonably accurate time, then I will NEVER trust any of their data to be reliable. Time is probably the simplest sensor to ensure accuracy.

3) You CANNOT assume a received packet was "just transmitted". There are too many "network" variables that can account for packets being received many minutes or hours after they were generated.

4) In the "real world" of meteorology, if a report does NOT contain the time it was observed, it's basically useless to everyone except maybe the reporting station. I will NEVER make ASSUMPTIONS about such fundamental data which is as vital as the sensor readings, and use those assumptions in any forecasts. If you are receiving regular reports from a station you MIGHT be able to assume the date, but that's about as far as I'd be willing to stretch it. In the APRS world, stations do NOT conform to reporting schedules like NOAA or other stations do (i.e. every 15 minutes, hour or 3 hours, etc)

5) I have serious reservations about the whole APRS weather program anyway, as it appears to be sadly lacking in conformity to established protocols like WMO, and few reporting stations can be routinely relied upon to provide reasonably calibrated and accurate data on a routine basis. (there have been very heated debates on this SIG where numerous people argued against the necessity to bother calibrating sensors to true north vs magnetic, a fundamental issue that seems to not be well understood!)

6) The only way to be 100% certain of the date/time of the weather data is for the station generating it to date/time stamp it when it is formatted for transmission. Now, there's an entirely whole different argument about how various weather "stations" collect and format data and subsequently the TNC (or not) sends it out - some stations do averaging, or other tricks, which may or may not be evident (I'm thinking of "instantaneous" versus "average"

or "smoothed" values like winds or rainfall) - it's difficult to weed all these out, each manufacturer may treat them differently, and NOT be anywhere near accepted protocols like WMO, which we all should understand and strive to emulate.

7) If a station really is "mobile" and providing weather data, I have serious concerns regarding many of the sensors. For instance, how are TRUE winds measured (it's NOT a trivial matter deriving true wind from relative wind in REAL TIME from a moving platform), barometric pressure (is sea level pressure being correctly derived from "station pressure" during changes in altitude), temp (how are sensors shielded from effects of cooling from vehicle motion), etc etc.

8) The accuracy of reports generated manually can also be of great concern, as is routinely evidenced by numerous conflicting positions of objects like tornados and tropical storms. For this reason alone, use of the APRS system for making urgent, life/death decisions, or a response decision affecting a large segment of the population (emergency preparedness/response) is not prudent.

Just my personal opinion. Maybe some of these points have not been considered before by some. This evaluation of the APRS wx system is intended for improvement, not condemnation.

>

If someone were looking at the time stamp, then there might be a reason for people to keep their clocks set. However, since no one does anything with the time, people don't bother, you can't make an assumption that this means their weather data is not reliable. I know I don't need to set my clock on the weather computer, so I don't.

>3) You CANNOT assume a received packet was "just transmitted". There are too
>many "network" variables that can account for packets being received many
>minutes or hours after they were generated.
>

Give me a reason that the packets can be delayed minutes to hours. I know the APRS IS better than anyone, and the most delay I've ever seen was 45 seconds occurring a month or so ago during the severe looping conditions. Two seconds or less is the norm. On the RF side, the worst thing I can think of is a transmitter with a squelch that opens for long periods of time, the weather station keeps sending a packet every 5 minutes into the buffer, eventually the squelch closes and sends all the queued up packets. At the receiver end, you see no data for a long time, then a bunch of data all at once, and it is pretty obvious something is wrong. For the most part this would be a one time event, I've never heard of this actually occurring, and certainly not on a repetetive basis. If you have something that actually occurred, please share it.

>From the introduction to the APRS spec:

"Fundamentally, APRS is a packet communications protocol for disseminating live data to everyone on a network in real time."

Every part of the APRS system is designed with this real time philosophy in mind. I challenge you to produce an actual situation that has a significant delay.

>4) In the "real world" of meteorology, if a report does NOT contain the time
>it was observed, it's basically useless to everyone except maybe the

>

But if the entire pipe is real time, with typical delays under a couple seconds, time-stamping the data when received is no different than stamping it at transmission, and in this case, far more accurate. Of course there has to be a time, but in this case it is keyed to the receiver's clock. If the time on the data is important to someone, then those users will have accurate clocks. findU has always used NTP to a first tier time server, so the data I forward to NOAA has timestamps that are accurate and consistant. A few seconds behind, no doubt, but we both know that is not significant.

>5) I have serious reservations about the whole APRS weather program anyway,
>as it appears to be sadly lacking in conformity to established protocols like

>fundamental issue that seems to not be well understood!)
>

There is no doubt that a hobby weather station is not going to meet the same standards for accuracy that a NOAA weather station will. Few people are able to place the wind sensor at exactly 30 feet in an unobstructed area, just to name the most obvious shortcoming. Fewer people will spend the thousands of dollars pro level equipment costs. However, NOAA seems to be finding the data quite useful, evidenced by my recent award. In case you aren't aware, the APRS/Citizen's Weather data is sent through a quality control system, you can see the results here, and compare to other sources of data:

http://www-sdd.fsl.noaa.gov/MSAS/qcms_messages.html

If you look at the monthly totals (some 316k observations) the Citizen's Weather errors are not wonderful, in fact the second worst in the list, but of course most of these others are professional installations. For some reason the dew point in particular is a problem at 16% questionable, but wind and temp readings consistantly are only 4-5% questionable. Even the NOAA owned sites show 1 or 2 percent. Given the differences in cost between these installations, I find the numbers very encouraging.

Things are even better if you spend time looking at individual stations. In the last two months, since I replaced a bad humidity sensor, my station appeared in the questionable list three times. Three bad readings out of (60 days * 24 hours * 4 readings/hour) is pretty damn good. Lots of stations in the CW network meet this sort of standard, most of the CW errors occur in a handful of stations. And BTW, if I were to be transmitting a timestamp, it would be wildly inaccurate, I do not bother to set the clock on the weather computer, and if the time got passed to NOAA then my good data would be interpreted as bad.

So in the REAL real world, APRS weather is objectively doing pretty well, given the cost of our gear...

>6) The only way to be 100% certain of the date/time of the weather data is
>for the station generating it to date/time stamp it when it is formatted for
>transmission.

And for the computer to have a clock synced to NTP or GPS. In the APRS world, this is never going to happen. So, timing on reception is the far better choice...even if there are a few seconds of error, that really makes no difference, and you avoid the sometimes wildly inaccurate times of the various TNCs, weather stations, and computers.

240. [aprssig] Baker to Vegas

From: Steve Dimse <k4hg@tapr.org>
Date: Fri, 12 Apr 2002 05:09:44 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73663-2002.04.12-04.43.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The Baker to Vegas run is coming up in just over a week. Over the past couple months I've had contacts from several different people involved asking about

```
tracking the event on findU. I sent each a lengthy discourse on what I needed to
set up a separate page, but so far I've not heard anything back. I have a
feeling at 6PM next Friday I'm going to be getting some frantic emails, so I'm
trying to be proactive...

I took the APRSdos map which was used on the old javAPRS page, and made a large
png/geo map of it:

http://www.findu.com/cgi-bin/plot.cgi?call=*&geo=b2v.geo

This URL can be used like this to show all the surrounding activity, or with
specific calls to track individual stations.

I would really like to do a special tracking page, as this event usually draws a
lot of traffic to my sites. If there is anyone on the sig that knows the
callsigns that will be used and which team they are associated with I'd love to
get a list, or put me in contact with someone that can help.

Steve K4HG

Let me echo that comment.  We have received NO data from PCsat (W3ADO-1)
over the USA since 3 April.  My current connection is to ahubcentral.
Maybe a few gates are down?

Bob

A classic example is Dead Reckoning in APRSdos. If your PC clock is off,
then DR puts every moving object with long DR lines all over the place.
What do people do? They HATE DR, and TURN IT OFF, rather than properly
setting their PC clock to the right time, date and TIme zone...

Head in sand...

Bob

What kind of good information exists on the web on setting up a Solar Powered
APRS-type Digi?

I've heard that the battery backup powered tornado/air raid sirens can freeze
up. Would the enclosure have to be heated/insulated in some way to prevent
this?

Is this practical or would the power consumption eat up the batteries
overnight?

Rendered body type: text/plain

One of the things I was interested in looking into this summer was
setting up a couple of digi's. One north of me and one south.

What kind of information is there on finding cheap tower space. I know

from working at a commercial radio station that commercial tower space
is not cheap.
I also assume I'd have to set up some kind of contract, like a right of
way.
Would I have to drop a power line and meter just for myself?
What do small repeater clubs do?

The location south of me that I was interested in was in a friend of
mine's wooded lot that sits behind his house. He's not an amateur. How
stressfull would this situation be? Is there any experience out there
with this setup.

Thanks in advance.

I don't plan to take readings while moving, but rather when stopped, and
the various sensors stabilize. It's easy to tell from the GPS data when you
are moving, afterall.

I don't have any specific web pages to offer, but for *any* self contained
solar power electronics you need to know:

How much current draw your equipment uses.
How often does it use it? (transmit current vs recieve current)
Hou much sun does the site recieve (cloud cover, and or obstructions) per
day.
Then you can figure out:
How big a battery you need (most folks say you need to be able to power the
equipment for two or three days on battery power alone .... even more is
better)
How big a solar panel (or panels) you need (to recharge a battery after the
above conditions, and also keep the equipment running while doing it)

Larger batteries also make the charging much simpler, since they can
tolerate overcharge better. If you size your panel properly, you can
charge the battery, then in the case of lead acid, the charge rate
automatically drops to near zero. Large nicads can take proportionately
large overcharge currents, but I wouldn't go beyond 0.05C for long term use.

Moving isn't the only issue. It is the weather conditions over a roadway
also. This includes temp (over black asphalt), humidity (a byproduct of
internal combustion is water vapor), wind speed (stand near the highway),
and visibility. Also pressure could have short term variations as well (the
wake of a truck).

I think you do skywarn, so for gross conditions I'd say it would be fine,
but in good weather, for prediction purposes, the data would be suspect.

-Jeff

Pressure would also have a problem do to elevation that would be
constantly in a state of flux. And no, GPS probably wouldn't fix it to
the precision it would need to be.

I'm working on a barometer right now for a project. I left home and
drove 30 miles and up about 700 feet in elevation. The barometer
recorded the proper drop in pressure. Then I got home again, and
when I looked at my log of the trip and compared it to the GPS,
the elevations didn't track the barometer. I was crushed! Then I
realized my 'outgoing' trip log on the GPS didn't quite match the
'incoming' trip log. But, the barometer readings at my house were
just 0.01" apart, leaving to returning. The GPS was over 100' in
elevation from leaving to returning.

Elevation is an iffy thing with most GPS units. At least, accurate
elevation is!

Sure, you could plot position and then figure out what the elevation
should be and...

>(the wake of a truck).

Sure, these will need to be compensated for.
Pressure variations can be damped at the sensor. I've dealt with this
before, with transonic airflow. Real variations that we are interested in
happen over many seconds, so that won't be a problem. A lot of the rest is
in choosing a reasonable place to park.. :)

>I think you do skywarn, so for gross conditions I'd say it would be fine,
>but in good weather, for prediction purposes, the data would be suspect.

Exactly.  But having data, as long as it's measured in a consistent manner,
is better than no data.
I don't see much difference between this automated approach, and our
current approach of reading out our Kestrels, except that the automatic
version frees up the voice net, and automatically logs everything, and
potentially allows for software to detect outflow boundaries.

If you wanted to correct for it, I'm sure that there's a map product
available that would give ground level altitude vs position.

For what we are doing though, it's plenty accurate enough, because we
aren't so interested in small, or long duration changes.

Frankly, it's pot-kettle-black. I've seen many fixed stations that are
obviously not calibrated, because the pressure differentials indicate
hurricane force winds that are somehow not being reported..

Ok ... sorry for ruffling any feathers. My originaly post was concerning a
MacAPRS WX station that I didn't see "properly"    It turns out after
sending him APRS messages, then corresponding via e-Mail, that he did have
his MacAPRS (ver 3.5.2) settings wrong!

According to him: "In MacAPRS there is a setting for UTC offset - but its
not obvious"  Since I don't have any experience with the Windows or Mac
version I was hoping somone else here would speak up and say "Yes, have him
check the UTC offset setting" or something of the sort.

Bob, "jumped the gun" and assumed the positionles packet system was the
problem ... and we all went from there ;-)  He has set his system
'properly' now and I see his icon just fine (at least a whole heck of a lot
better than before)

255. [aprssig] Timestamping and MicroWeather

From: "David R. Andersen" <k0rx@RXcomm.net>
Date: Fri, 12 Apr 2002 12:51:04 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73734-2002.04.12-13.25.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Timestamping of weather packets is very important. The data is
essentially useless if not anchored temporally.

 From the MicroWeather web page...

  MicroWeather will key the radio and transmit
  time-stamped, APRS-formatted 1200 baud packet
  weather data at regular intervals. [note: the
  packets are also position-stamped]

The standard MicroWeather clock exhibits "quartz-watch"-type accuracy.
In addition, there is information on the page about using a TXCO to
achieve an extremely accurate clock.
```

Its much cheaper than a Peet Bros. or Davis wx station and it has far
better accuracy and resolution than an OSI wx station.

No TNC is required.

It reports temperature, humidity, baro pressure, wind speed, and wind
direction (the wind data requires the 1-wire anemometer). Shortly it
will also report rainfall.

Its available now in kit form. Read about it at the project web page:

Ray responds:

Well, yes I am interested in small changes, or long duration trends. You may
not typically care at your QTH, if you live let's say in Alaska, that see a
constant progression of large low pressure systems advance throughout the
winter. Your barograph will look like a roller coaster. But take, for
example, a Caribbean Island. Over tropical waters the barograph can be
almost flat for days and weeks, the only variation being small diurnal
changes of between 1-3mb, almost barely noticeable on some instruments.
You're only indication of an impending storm might be just a slight bump in
this otherwise very predictable cycle, and it might not be a large bump. So
if you aren't careful you could easily get walloped when you weren't watching.

The whole argument about altitude not being important is trivialized. You
may not realize it, but a change of only 125 feet equals a difference of
about 6mb, hardly trivial. Failing to calibrate to sea level pressure makes
your entire reading practically useless to others, who are not usually aware
of the relation of your altitude to theirs. Without a common reference, sea
level pressure, a barometric pressure report is about as useful (read
useless) as a bunch of wind vanes referenced to magnetic north.

>Well, yes I am interested in small changes, or long duration trends.

Different places, different weather, different solutions.
Our major threat is tornadoes, and severe thunderstorms, which have large amplitude, relatively short duration baro changes.

Temperature is also interesting, but we aren't so much interested in the absolute values, as finding boundaries between different temperatures. A 5-10F shift in less than a mile is typical.

I suspect you don't get a lot of tornadoes in alaska though.

:)

Rendered body type: text/plain

Both "positionless" and "complete" weather are allowed in the spec. The following is not meant to favor one over the other, but just to explain some of the differences in how they evolved and where they apply...

On Thu, 11 Apr 2002, Keith Sproul wrote:

> Bob has for YEARS asked us to reduce reduce reduce reduce bandwith...
> If I am stationary, my position should be sent LESS often, i.e. once
> an hour or maybe once every half hour.. (my opinion is once an hour).
> Now when someone starts up and querries the network, I can send my
> position so I show up on their map..

One example of the differences is for mobiles. Driving through on the interstate where I would like to see local weather, 30 minutes to an hour (if one packet is lost) is a long time to wait for a useful weather report on my Kenwood. (Note, Kenwoods cannot query for position.)

> Now, If I am transmitting weather EVERY 5 MINUTES (like a lot of the
> weather people want), then I am transmitting my position 6 to 12
> times MORE than I need to.. That is a LOT more bandwidth than is
> needed.. Especially since a position is about 20 characters EACH
> TIME it is sent

Actually, Sproul's method of sending position and weather data separately is the right choice for their position packets which contain a lot more information:

```
WN4XXX>APW240,WA3YLO-13,KA3ATI-11,WA4XYZ-10*:=3909.01N/07532.45W_
              PHG5570/WinAPRS 2.4.0 -NJHUNLEBANONT-240-<530>
```

This is over 110 bytes which conveys data not included in the 20 byte position portion of a complete weather packet. These longer position reports can include PHG, a few copies of the Software version, the County and State abbreviation, and the type of processor plus any other text the station needs to include. Most of this was asked for by the WX people...

> THIS IS WHY THE POSITIONLESS WX packet was developed.. This is VERY
> important for HF which was important to APRS people...

Well, here I think the key to success on HF is short packets.

```
Position: =3909.01N/07532.45W_PHG5570/WinAPRS 2.4.0-NJHUNLEBANONT-240-<530>
Weather:  _01041345c008/s007/g010t051r000p001P000h00b10308wU2K

Complete: =3909.01N/07532.45W_123/010g005t070r010p001h00b10308dU2K
Grid-Fmt: >FM19SX/_123/010g005t070r010p001h00b10308dU2K
Cmpressd: =/YYYYXXXX_csg005t070r010p001h00b10308dU2K
```

The complete format is 4 or so bytes longer, but it is complete and no other packet has to be received before it has value.. The compressed version is even shorter. The complete Gridsquare format might even be OK for HF where the position is human readable and position ambiguity of a mile or so is OK..

> Also, the amount of data that the weather people wanted was making
> the packet longer and longer, to the point that it was
> well over 80 characters, or at least could have gotten that long..
> The positionless WX report is in the spec and is (currently) allowed,
> supported etc..

Agreed, and they both have their place. But the main difference between the positionless weather and the complete weather format is that the complete one contains 20 bytes of position in every packet, and the positionless one replaces that with about 10 bytes of DATE/TIME and format characters. So the difference is really only about 10 bytes when you consider Steve's comment that the date/time stamp is unreliable and almost always ignored..

But even if you consider the complete format to be 20 bytes longer, you can still send 6 complete formats every 5 minutes and use no more total bandwidth than the same shorter 6 positionless packets plus one full size position packet every 30 minutes.

Its basically a difference in APRS philosophy. I think of APRS as something that gets turned on and activated under stressful conditions when people need live data. Or for mobiles. Thus, all packets should be complete.

I think the Sprouls approach was to provide a comprehensive 24/7 weather system for all the Hams that support the National Weather Service covering larger areas of more permanent data. This assumes that people are on 24/7 and so they already konw where the weather stations are..

>computer, so I don't.

Ray replies:
So the data a weather station collects is not useful for themselves? The primary reason I have a wx station is to track trends and to use the data for forecasting. If I didn't know when my data was collected it would be of little use to me. Being able to pass the data to the network is secondary. I view it as a fundamental question of quality control. Back in the days when all the instruments were manual, part of the process of taking a weather observation was to check the condition of the instrument to ensure it was reliable and consistent. I guess the advancement of technology relives the individual of any responsibility to QC his data - put it up, turn it on, and walk away. Bob has shown that bandwidth really isn't such a big issue, but it looks like we all just have to agree to disagree. For me, if I don't record the time of my observations I haven't taken a complete ob, plus they have little value to me. And I can't shift that responsibility to anyone else. I see your point, but it's not the solution that works for me. I can't control how you treat the data when you receive it. I am concerned, however, about changing a time stamp if there's a significant delay between transmission and receipt. It would corrupt my data. I concede a few seconds or a minute isn't too significant, but beyond that I would expect you to discard the data as suspect, not automatically change the stamp and archive it anyway.

Of course the data is useful for some stations. However, as I stated, if the time on your computer is important to you, then you will make sure your clock is accurate. Those people who don't use the data on their own computer (and most APRS users fall into this category) are less concerned. I'm using MacAPRS as the client program on my weather station. One of these days I'm planning to write my own thin client (does nothing but forward weather reports to RF and the APRS IS, so I can connect the weather station to a linux box without the overhead of a full client. Until then, I depend on findU for looking at my weather data, and I suspect so do a lot of others.

>Being able to pass the data to the network is secondary.

To you perhaps, but for me it is the primary purpose, both for forwarding it to NOAA and for my own personal use.

>I view it as a fundamental question of quality control. Back in the days
>when all the instruments were manual, part of the process of taking a weather

>walk away.

Far too many do, I'm not one, I love using the CW feed to check the validity of my collected data. However poisoning the data by using bogus timestamps does nothing to force them to improve their clock. Oh, I'm sure if findU used the timestamp in packets containing one, some people would set their clocks more closely. But as long as findU is off a couple seconds, and can stamp every packet, why not use that?

>Bob has shown that bandwidth really isn't such a big issue, but
>it looks like we all just have to agree to disagree. For me, if I don't
>record the time of my observations I haven't taken a complete ob, plus they
>have little value to me.

I agree with you, there must be a time. However, as I say, for myself and I many other weather station owners, the data is not logged to our own computers, but rather sent to the network. Even I don't have a program that can manipulate a saved weather log file and produce a trend. Mac/WinAPRS has a nice graph display which I emulated with wxpage, but it is limited to 24 hours, you cannot set the options or look at old data. What program do you use to look at trends?

>And I can't shift that responsibility to anyone
>else. I see your point, but it's not the solution that works for me. I

>or a minute isn't too significant, but beyond that I would expect you to
>discard the data as suspect, not automatically change the stamp and archive
>it anyway.

If I did that most of the data would disappear. Again, perhaps that would force people to pay more attention, but it would also turn me into a policeman and force me to spend a lot of time explaining things. I've donwe that in the past on different problems in APRS, not my idea of a fun time.

Certainly if there were reasons to suspect long propagation delays within the APRS system, then you would have a point. I challenged you to produce one, and in the absence of one, perhaps you can agree that for now this is an acceptable solution for the needs APRS users. It doesn't work for you, fine, but you are already logging the data to your own disks with your own timestamps, so why object to something that works for the system as a whole?

I see this as another of the purist vs. pragmatist arguments. I'm a fervent pragmatist. If it works, keep it, if it is broken, fix it. I've done plenty of both in my time. I've never seen the point of disrupting things to make them "pure", as in the recurrent debate about using port 23 for the APRS IS feed.

```
>From: Steve Dimse <k4hg@tapr.org>

>I've never seen the point of disrupting things to make them
>"pure", as in the recurrent debate about using port 23 for the APRS IS
>feed.

That is a different animal altogether. The APRS weather stuff is/was new
with new ham standards where as the IP port numbering scheme was a existing
standard, outside of amateur radio, which some still continue to thumb their
nose at.

In any case, see no reason to bring a unrelated red herring in. Stick to the
topic at hand.

-Jeff

I recently started seeing this problem but it does not appear to be a router
issue.

When WinAPRS comes up it attempts to open a port at aprs.net 10151 which is
no longer used. I have not
really looked into the problem too much, a bit of laziness' here. All that I
do is close the port and then connect to one of the AHub ports on 2023 for
my Igate.

If you can close the original port that first opens up and then attempt to
open one of the active ports
and get results it is not a port issue. Be aware that you must have a edited
aprserve.txt file in the WinAPRS directory
with all of the updated ports so that you will have the proper selections
available.

Rich

I have the same problem with out a router, just the cable modem to PC, and I
get the same " TCP open failed."
I also don't know how to fix this.

266. [aprssig] Visual Satellite Display

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 12 Apr 2002 19:18:41 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73761-2002.04.12-18.52.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just posted a program that will show graphically the elevation angle and
polar plot of all visual satellties that will be in view in the next 10 to
30 minutes or so. See the screen shot:

http://web.usna.navy.mil/~bruninga/photos/visual.jpg

It is ideal to run in real-time when outdoors after sunset. It is hands
off, in that the display just always shows you whats up there, and there
is almost always something up there within 10 minutes or so. The amateur
satellites (not visible) are shown solid so you can't miss them. But all
the others are from the VISUAL subset of Tom Kelso's CELESTRAK site.

The whole program and keps file is less than 120K. Actually, it is just
an extract of the graphical time display of APRStk... and the PCSAT
program...

Download: ftp://tapr.org/aprssig/dosstuff/APRSdos/visual.zip

I did it up today because my wife was going to be having a star-party
tonight at her telescope, and I thought it would be neat to see any
satellites.. It is kinda crude, but works great!

In a message dated 12-Apr-02 13:37:30 Pacific Daylight Time, k4hg@tapr.org writes:

>What program do you use to look at trends?

Ray replies:
I currently have two methods to do this. Primarily I use WeatherView32 (http://www.weatherview32.com/) for my casual needs, as it has the slick dials and graphs built into the interface. It also includes an almanac so I can compare historical trends. It's a supercharged interface to enhance the limited functions of the WX200 display unit. Because I have sufficient serial ports available, I can run it concurrently with WinAPRS. I just split the serial data line to feed both ports. I'm not seeing a MAC version on their web site, however, maybe it will run under Win-emulation.

I also have a much more professional program I inherited from my work. It is a custom application produced by NOAA designed primarily as a data logging system on oceanographic research vessels. It can handle 64+ serial ports, log directly from a TCP/IP socket, and is evolving HTTP support as well. With this I can log each sensor on a separate port, plus the software has the ability to parse any part of a serial or NMEA sentence then recombine these into unique NMEA strings for custom outputs. For instance I can take a GPS sentence, strip the lat/long, then add that to the heading from a gyro compass or 3-D GPS, then insert wind speed/direction and water depth or temperature. Logging can be done at 1 second intervals, or any interval that is appropriate. Each sensor is logged independently and is given a date/time stamp, unique file name, and can be placed in any directory you like. There are also some trend graphs available, as well as gauges for instantaneous readings like wind speed or heading, but these functions are only included as a frill. If I want to really play with the data I would use MatLab or maybe ARCView.

Steve commented:
> Certainly if there were reasons to suspect long propagation delays within
the
>APRS system, then you would have a point. I challenged you to produce one,
and
>in the absence of one, perhaps you can agree that for now this is an
acceptable
>solution for the needs APRS users. It doesn't work for you, fine, but you are
>already logging the data to your own disks with your own timestamps, so why
>object to something that works for the system as a whole?

Ray replies:
Swapping my meteorologists hat for that of a network administrator, you yourself previously gave several good examples of how data can be substantially delayed. I think it would be extremely difficult to analyze your database to extract any real evidence, since many stations don't include a time stamp from the originator, and if they do you replace them with your own. How could we tell if data were delayed at FindU? Just thinking out loud here, if someone's ISP choked and built up let's say a six hour backlog of wx data in the queue, then the problem was fixed and it spit it all out at once, how would your system deal with that? Receiving maybe 100+ reports from a single source but since they would be received almost at the exact same time, would you have 100 data points all piled on top of each other, but with varying values?

TCP/IP isn't perfect. Yes, it works marvelously most of the time. But just think about this SIG, there have been times when something got Gumped in the server and it started generating dupe postings from weeks/months back. That's the kind of thing I see as a major problem. Sure, a big event would likely get noticed, the occasional wayward datagram probably not.

Maybe I'm spoiled. For me, the timestamp is one of the first QC checks, allowing me to discard data that gets out of sync. Luckily NOAA does this for us as they ingest our data, they too discarding data that appears out of range or illogical. I guess I'd have a very hard time sending raw data with little or no way to QC it. Obviously some don't feel the same way. One of the nicest features of the NOAA software I use is the built-in QC program that alarms when data is interrupted or falls outside set limits. Of course this is way beyond the scope of the hobbyist.

I concede that your method does smooth some badly formatted data (those with grossly innaccurate clocks). But it won't make the meteorologists happy, and won't provide any clues when data IS received after a long delay. At least the date/time of the data will appear normal, although the sensor values will likley force NOAA to spit it out if it appears unreasonable. So in that regard it's swapping one problem for another. Or at least shifting the responsibility to the user of the data to check its validity as best they can.

I can provide a personal experience. I came home one day from work and discovered the TX light on my TNC was on, and the transmitter was keyed up, and was as hot as a habenero pepper! It must have been stuck in TX for hours, even though I swear that there's supposed to be a time out loop in the TNC to prevent this. No way to determine exactly when it locked or for how long. Luckily it wasn't when I was away from home for a longer period. Certainly the rig would have melted down eventually. I know it likely gridlocked the frequency for most of Puget Sound. I probably won't leave any of my gear unattended for very long ever again. And sending APRS wx for only a few hours a day is not very beneficial.

I don't know what the best answer is.

I have subscribed to this magazine for several years. It is one of the best sources for alternative energy information that I have found anywhere. While it is not ham oriented it has articles that describe systems that can be adapted for ham use and the content is designed for the average person not engineers. Now for the best part the entire magazine can be downloaded in PDF format FREE. It has far more than just solar.

Rendered body type: text/plain

I just noticed some signals coming through tcpip from a truck driver in Canada. If someone knows VE4DS-9, maybe they can contact him and help him adjust his path. This is what I copied on his transmission by the time it got to SW Washington:
WIDE3-2,WIDE3-1,WIDE3-2,WIDE3,WIDE3-2,WIDE3-2,TCPIP,KD7NM (last call is where I think it got fed into the RF side). I don't know whether the transmissions would actually propogate to all the paths that have been entered, but at least it would help to shorten up his transmission periods.

Bob, KB7ADO

>I agree with you, there must be a time. However, as I say, for myself and
>I many other weather station owners, the data is not logged to our own
>computers, but rather sent to the network.

This may be true for people who started with APRS and then added weather stations. However, I suspect that the weather station manufacturers didn't develop the computer interfaces and software to run them just for giggles. I would bet that the majority of people who have a weather station log the data for their own purposes.

Personally, I'd love to make my weather data available to others (there are no currently active APRS weather reports within 100 miles of me) but I'm not about to risk a gap in over 4 years of recorded weather data by switching programs and I haven't been able to get any reference to what format my APRS software expects. I can easily set my current program to automatically download the data and it will even dump the latest data in a well-defined location so it would be trivial for me to write a conversion program if I just had the format...

>Even I don't have a program that can manipulate a saved weather log file
>and produce a trend. [snip] What program do you use to look at trends?

The computer interface for my station came with a very nice little program that does that just fine. I can look at trends over all the saved data I have if I want to. It even generates NOAA format reports.

Make that all. I've seen somewhere in the description of the GP System

(sorry, don't have an exact location) that altitude precision was
sacrificed in the design in favor of horizontal position.

Err, page 62-67 of the APRS protocol manual? 72-77 in the PDF file's
index...

APRS Protocol Manual:
  ftp://ftp.tapr.org/aprssig/aprsspec/spec/aprs101/APRS101.pdf

Grab your data, calculate some statistical info, format a report, then
send it out to an APRS server or TNC. I use a PERL script to do just
that.

More to the point: When one employs trilateration for the purposes of
determining a position of interest, it's pretty easy to get adequate

geometry for very accurate horizontal position determination, when located at a point on the general surface of the earth (differentiating here from those in deep, steep-walled valleys or urban canyons) with good, unobstructed sky-view. In order to get as accurate 3-dimensional positioning one really needs a reference satellite in the group of 4 used for trilateration at a position approximating -Z. Since RF propagation through dirt is problemmatic, we settle for using satellites that are above teh horizon, and we do sacrifice some accuracy in vertical.

Further, if one uses satellites too low on the horizon (signal passing through too much of the troposphere and ionosphere) at least for autonomous determination using solely the L1 frequency, the delays are unmodeled, and cannot be adequately mitigated in processing. This adds to the error budget, and is especially obvious in vertical determination.

At a recent Institute of Navigation meeting, one of the papers did a rigorous evaluation of the error budget in vertical with regard to horizontal autonomous and differential/differenced position determinations. This review showed mathematically that the accuracy of vertical determinations, save under the most rigorous differenced determinations, was on the order of 1.414 (ie., SQRT(2)) worse than that of vertical determinations. This finding, consistent with anecdotal evidence, proposed a set of error budget adjustments for vertical (autonomous) determination.

'Nother point. 'Elevation' cannot be determined by GPS. what can be calculated directly is 'Height Above Ellipsoid.' Recall that the ellipsoid is the surface created when one rotates an ellipse (the general form of a circle, with flattening of the semimajor access, creating an object with 2 foci rather than the circle's single, merged focus) about its semimajor (shorter) axis. The various ellipsoids used in geodetic work, including the Clarke-1866 Ellipsoid associated with WGS-84, virtually all provide a smooth-surface approximation of the Earth's surface suitable as a starting point for geodetic calculation.

"Mean Sea Level" is not used when one determines vertical using GPS, as it's a subjective datum that fails to account for gravetic variations of a relatively local nature. Thus, attempting to close a vertical surveying loop between, say, Galveston, Texas, and Boston, MA, would yield a result that's less than stellar. One of the classic examples of this is the difference in gravetic potential between Northern and Southern California. Significant closure issues arise there.

In the geodetic world, we now use, for the purposes of vertical work, the concept of a 'Geoid' which is the undulating surface defined by a constant gravetic potential. The current Geoid in use in the Continental United States, as determined and published by the National Geodetic Survey, is Geoid99. The Geoid is periodically reviewed and updated, based on densified local absolute gravity measurements and improved modelling tools. As the process of local absolute gravity determination is time-consuming and requires some finnicky and large hardware, it's non-trivial to densify a large area, such as the United States.

There is a separation or difference between the geoid and ellipsoid at most points. The GPS geodetic model accounts for these deltas in an area-fashion. In other words, while one could populate a database with deltas for individual points, one can as well calculate the separation for wider areas, due to the sparce nature, even now, of local gravity data. Orthometric height is the derived value one gets when one carefuly determines the 3-dimensional position with respect to the Ellipsoid, subtracts the Geoid separation, and accounts for angular difference in local vertical.

Orthometric height corresponds pretty well to what we think of as "Mean Sea Level," but is a more objective measurement of vertical accounting for distance from the centroid of mass of the Earth, local gravity, and angular deltas in vertcial caused by local gravetic anomalies.

I think some people might confuse store-and-forward EMAIL and Datagrams.
Datagram packets are quite different.  Email is supposed to be delivered
and every system holds it until a path is found for days and days.
Datagrams (APRS packets) are live and are delivered in seconds.  If there
is a problem, they die...

Time-of receipt is far more reliable (since the recepient can verify the
accuracty of HIS clock) than the random settings of 10,000 home PC's...

PCsat has had a perfect recovery and is fully functional on daylight
passes.  Since it recovered Last Sunday, it has not had one reset.
This is a big change from 14 resets a day for 25 days!

We encourage daylight operation only so that we dont run the batteries
down at night, but if you are doing a special demo for a group or club or
other special activity, or are traveling in remote areas, you are welcome
to send a few packets at night.

If you received a packet with that path on TCP/IP, then it should
be in Findu, right? I sure can't find a packet like that at
http://www.findu.com/cgi-bin/rawposit.cgi?call=ve4ds-9&amp;start=36&amp;leng
th=36

I would suspect a packet collision or something rather than such
an incredible path.

I have subscribed to this magazine for several years. It is one of the best sources for alternative energy information that I have found anywhere. While it is not ham oriented it has articles that describe systems that can be adapted for ham use and the content is designed for the average person not engineers. Now for the best part the entire magazine can be downloaded in PDF format FREE. It has far more than just solar.

Message-ID: <LYR842-73950-2002.04.13-12.39.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Good morning everyone (or whatever time it is when you read this),

First let me introduce myself, I am Ralph G. Sbragia, CSP, ham radio call sign W6CSP. I am the B2V APRS co-coordinator for the Orange County, CA, Radio Amateur Civil Emergency Service (OCRACES).

Those of you who have been around this SIG a while may recall that each year about this time a message gets posted about atypical designators that will be seen in the area to the west of Las Vegas and other parts of the country. These are tracker boxes that are being prepared and tested in support of an annual 120 mile footrace participated in by over 200 teams of twenty sworn law enforcement officers each. It is called the Baker to Vegas Challenge Cup.

Each year OCRACES supports as many as forty teams with APRS related services. One of those services is a JavaScript map of the race course which is fully interactive. This allows family, friends and fellow officers back home follow their teams progress.

As the email below discuss, our applet no longer works due to the closure of the aprs.net server. Although findu.com is a great site and provides superb service, it is inadequate for our needs. Team captains and members in Las Vegas and other areas need to be able to zoom in on the map to determine specific locations for their teams. At the same time they also desire to zoom out a little and see where other teams are. In short, our customers have come to depend upon the interactive nature of our map via the applet.

I thought I had a solution: another server site (ahubca.net) offered to let us connect for the data stream. However, when I changed the port and server information on the web page, I still got back an "error opening data source" message. I know the server works because I put it into my aprserve.txt file for WinAPRS and I can get WinAPRS to open the server and pull in data.

Currently, I am having troubles editing our OCRACES website, so I have a test page at
www.gwsafety.com/APRS/aprs-live.htm . If anyone who knows java better than I (and that should be a whole lot of people ;-)) and can look at the code and figure out what I need to do to make it work, I will be forever in your debt.

Steve Dimse - Thank you for your efforts on our behalf recently and in the past. The findu site is really great (I taught my parents how to use it with their new computer so they can know where we are.) Unfortunately, it doesn't work well for this specialized event. If we can just get an alternative data stream to work, things should be fine and dandy. Thank you again for your help.

My thanks in advance to any and all who can help me with this.

Regards & 73,

Sgt. Ralph G. Sbragia, CSP
W6CSP, County of Orange RACES

Sent: Friday, April 12, 2002 2:10 AM
To: TAPR APRS Special Interest Group
Subject: [aprssig] Baker to Vegas

The Baker to Vegas run is coming up in just over a week. Over the past couple months I've had contacts from several different people involved asking about tracking the event on findU. I sent each a lengthy discourse on what I needed to set up a separate page, but so far I've not heard anything back. I have a feeling at 6PM next Friday I'm going to be getting some frantic emails, so I'm trying to be proactive...

I took the APRSdos map which was used on the old javAPRS page, and made a large png/geo map of it:

http://www.findu.com/cgi-bin/plot.cgi?call=*&geo=b2v.geo

This URL can be used like this to show all the surrounding activity, or with specific calls to track individual stations.

I would really like to do a special tracking page, as this event usually draws a lot of traffic to my sites. If there is anyone on the sig that knows the callsigns that will be used and which team they are associated with I'd love to get a list, or put me in contact with someone that can help.

Steve K4HG

290. [aprssig] Re: MFJ-1278 commands

From: Bob Nielsen <nielsen@oz.net>
Date: Sat, 13 Apr 2002 10:14:54 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73954-2002.04.13-12.48.54--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In packet mode it uses TNC-2 commands with some extensions for the mailbox, etc. The 1278 does some other modes which a TNC-2 does not. The TNC-2 commands can be found in the TNC-2 system documentation at:

ftp://tapr.org/software_lib/tnc/tncdocs.zip

The 1278 has some jumper settings which allow it to use a TNC-2 compatible EPROM. This would permit you to use UIDIGI, which will perform much better as a digipeater than the standard firmware. Unfortunately I do not know what those jumper settings are, but hopefully you can find someone with a 1278 manual.

73,
Bob, N7XY

The problem is the security manager for Java. In brief, an applet, any
files it loads (like the icon and map files in the case of javAPRS),
as well as any network connection it makes (like the live data feed)
must load from the same place. If you look at the old source you will
see the applet and map, as well as the data stream all came from
www.aprs.net. This was why I had begged people to not use www.aprs.net
once we set up first, second, and third...the javAPRS connections had
to come from that host.

There are a couple of choices here....the best, since ahubca.net has a
web server, you can try to get the map and javAPRS with all its
support files placed on their web server. The other choice is to get
everyone that will be using the applet to either run a stand-alone
applet runner or a browser which allows you to turn off the security.
IE 5 for the Mac allows this, I suspect Windows versions do as well.
The option is in the Java preference panel, under network access
select Unrestricted Access. THIS IS VERY DANGEROUS, and if you use
this option you should remember to re-enable security after the event,
and not browse any other web sites. With unrestricted access, an
applet can do all sorts of nasty things, for example send spam that
seems to come from your computer. Malicious applets exist...BE VERY
CAREFUL, you have been warned!

Thank you
>again for your help.

What exactly do you need to do in javAPRS that you cannot do findU?
There is a lot more I can program it to do than I ever could do with
javAPRS, so if there is something you want, I might be able to do it.

Rendered body type: text/plain

I don't think that it is an AFilter issue, since Afilter only access the
specific ports that you have specified. Have you tried accessing the radar
images with AFilter shut down?

The data is not delayed at findU, it processes it within milliseconds.

Yes, that is what would happen, if your scenario were possible. However, the data here is a stream, not a file. The ISP would have closed the pipe long before 6 hours, a few minutes would be the normal length of time for a router to hold packets it cannot deliver. In addition the APRS client program would have dropped the connection after 15 minutes tops (usually much shorter but depends on the client) if the connection were not active. The central server as well would have noted the dead connection and closed it.

>TCP/IP isn't perfect. Yes, it works marvelously most of the time.

TCP notices if a packet gets waylaid, and requests the dup. That is
the whole opint of TCP. UDP packets get dropped without notice, TCP's
do not.

Of course, APRS packets get dropped all the time, and missing packets
are the norm. Take a look at the 12 hour graph for my station:

http://www.findu.com/cgi-bin/wxpage.cgi?call=K4HG&last=12

There are two obvious gaps where reports were dropped, in this case
due to the way MacAPRS detects dropped connections. Other packets get
lost due to RF collisions. All these things simply result in lost
data, not delayed data.

Yes, some people don't provide quality control on their data, but the
point I maintain is that when everyone knows that no one looks at the
timestamps on packets, there is no pressure to keep your clock set. I
do watch my QC data from NOAA very closely, and yet my clock is not
set, because it just doesn't matter.

>I concede that your method does smooth some badly formatted data

NOAA seems very happy with the APRS data. I'll grant you that if the
data was ever delayed that would be a BAD THING, but the way the
system is set up it simply does not occur.

What is the point here? That APRS data is subject to jamming? Of
course, but no data appeared with incorrect timestamps because of your
hardware failure.

> Thanks, Dave N0XBN
>

A standard TNC2 doesn't make a very good APRS digi because it doesn't understand APRS-style WIDEN-n digipeating, dupe suppression, etc.

Remove it's ROM and substitute a UI-Digi firmware EPROM. It will make a far better APRS digi and no fussing with settings is required at all (after you burn the customized EPROM). This firmware, developed by Marco Savegnago IW3FQG,
converts any TNC2-type device into a dedicated APRS-specific digipeater with your callsign, paths, beacon messages, etc actually frozen into the eprom so they can't be lost from accidental resets, power failures, etc.

For the details, see:
http://gw.ir3ip.ampr.org/~iw3fqg/uidigi.htm (Scroll down past the Italian part for the same text in English)

This code requires a 27256 eprom. I have been using (twice as large) 27512s so that I can keep the TNC's original firmware and UI-Digi in the same ROM.

You edit a parameters file (a basic text file) to specify your personalized settings which are then overlaid on the base ROM code when the EPROM is programmed.

As I have mentioned on this list before, I am willing to program proms for anyone interested, if they email me an edited overlay code file and snail-mail me a 27C256 or 27C512 EPROM.

Go SOLAR! See elsewhere on this SIG. The cost of running PWR and the
minimum needed to pay just to have it outways the costs of solar.

You need...
One modern HT that doesn't consume much power in RX.
One small solar panel about 1 to 2 amps.
One solar charger regulator.
One Gell Cell 17 aHr minimum.
One enclosure (WX Proof)
One high gain antenna.

I don't have an e-map so I can't prove what I am going to say, but
this is what I find on my Garmin III+;

Changing the display format does not change the NEMA output stream.

HOWEVER, changing the datum you are using will change the NEMA output
stream.

You can see it for yourself if you have the data cable.   Run any mapping
program that lets you have NEMA input (Not GARMIN mode) and note your
position. To make it easy on yourself, run the GPS in the simulator
mode. Then go into the setup and change the diplay format and your
position on the mapping software will not change. But if you change the
datum you tell the GPS you are using to plot the information, your
position on the mapping software will change.

Unless they do it wrong, NMEA is normally DDMM.MMM or DDMM.MMMM
depending on several arcane internal decisions, often associated with
the presence or absence of differential (and now WAAS) correction.

A 1278 is not a TNC-2. Far from it!
There are no options other than using it as is or placing it in KISS mode
and using it with an external program.

304. [aprssig] APRStt Universal Email scheme

From: Bob Bruninga <bruninga@usna.edu>
Date: Sat, 13 Apr 2002 19:16:07 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS SIG <aprssig@lists.tapr.org>
Message-ID: <LYR842-74004-2002.04.13-18.49.55--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
APRS EMAIL additional ideas:  (Keith, note details)...

One of the objectives of the APRStt Touch Tone program running at
every repeater was to allow the entry of APRS Email from any HT
via TouchTones.  The key strokes would be the same on a dumb HT
as they are on the Kenwood!

But further, it would greatly simplify the constructs to minimize
keystrokes.  It would do this by holding a 10 cell memory for each
user to pre-enter frequently used Email addresses.  Then the user
only needs to enter a single digit for each email address.

Here is what we have at present:

   To: EMAIL   MSG:Email@Address message...

Here is what I want to add as the following additional formats

   To: E       MSG:Email@Address message...    <== same as before
   To: E0      MSG:message to your own email address
   To: E1      MSG:message to the 1ST person in your personal list
   To: E2      MSG:message to the 2nd person in your personal list
   To: E9      MSG:Message to the 9th person in your personal list
   To: E?      MSG:Send a dump of the 10 memories to the addr in E0

Now, what this means is that each person has a 10 cell memory in the
local APRStt.  And each user can edit and maintain his list of Email
addresses himself on line or over the air as follows:

   To: E0 ADD  MSG:My_Email_Address
   To: E1 ADD  MSG:New_Email_Address in location "1"
   To: E2 ADD  MSG:New_Email_Address in location "2" etc

For security, once you enter your own EMAIL address in E0, then any
time from then on that there are ANY changes to any of your 9 EMAIL
memories, the EMAIL Engine sends a confirmation EMAIL to that E0
EMAIL address.  In addition, once a month, the EMAIL engine sends
you a complete list.  You cannot change the E0 Email address over
the air!

This not only makes it triival to send EMAILs to long EMAIL addresses
for users of TouchTone only keypads (APRStt), but also even the kenwood
users will benefit by the tremendous reduction in keystrokes required.

Now.... drumroll....@ # @ #...     HERE IS THE BRAINSTORM!
```

I came up with this concept for APRStt, but then realized that every copy of APRStt on every repeater would have to have its own EMAIL memories, and this would be a royal pain. But with Keith's WU2Z Email server serving the entire planet, then if it held everyone's 10 EMAIL memeores, then the end user with his HT and TTone pad could send email from anywhere on the planet using the same shortcuts!

There would only be one central server and only one central list of emails. Thus, I would not have to implemente ANYTHING in APRStt, since all it has to do is just do the straight forward TouchTone to APRS message conversion and send it on APRS. Then Keith's WU2Z engine would see these abbreviations as above, and take action from there!

Wow...

So the only modifications to the existing WU2Z Engine would be these:
1) Reserve memory for 10 memrories for every APRS user
2) Recognize the single letter "E" as equivalent to the existing EMAIL
3) Recognize the TO ADDRESS format of "E# ADD" as a directive to take the first word of the message (just like now) as the Email address but place it in memory location #.
4) Accept no entries until E0 has been entered. Then send a confirmation EMAIL to that location including a PASSWORD for the user. This password is necessary for any future changes to E0.
5) Accept all other E# ADD entries into memory locations #.
6) On receipt of an "E?", or after a timeout of say 5 minutes, then dump the complete list of the 10 memories to the EMAIL address in E0.
7) On receipt of "E#" then send the message as email to the address In memory location #.

That is all there is to it.

Now if the user wants to ever change E0, then he has to send a real internet Email to the WU2Z Email engine with the matching password. Only if it matches will the WU2Z engine allow a change to E0.

We could also add:

To:WB4APR-E   MSG:message goes here

This is a NORMAL RF or Internet LIVE packet message to WB4APR because all APRS client software is supposed to capture any message to any SSID of the root call. BUT it is also an instruction to the WU2Z EMAIL engine to also capture it and send a backup copy as an EMAIL to the E0 EMAIL address that is currently on file for WB4APR!

Thus he gets it live if he is on the air, or by Email later and the ORIGINATOR does not have to know the EMAIL address! Thus the worldwide WU2Z EMAIL engine can send EMAIL to ANY ham radio operator from any other HAM radio operator and all they have to know is your call!

And it is simple so that ANYONE can remember it. AND, once I get APRStt working, then this is not limited to APRS Kenwoods either, anyone with any TouchTone HT can do the same thing!!!

305. [aprssig] Re: MFJ-1278 commands

From: "Tim Cunningham" <tim_cunningham@mindspring.com>
Date: Sat, 13 Apr 2002 21:03:30 -0500

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74012-2002.04.13-21.41.42--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

While it may not be a TNC-2, it can be altered to work "like" a TNC2.
In the MFJ manual, they have documented a header plug for replacing
IC's U27 and U28 with some hardwiring for the baud rate and
radio port electronic switches in the unit.

This will allow the 1278 to operate most TNC-2 like firmware such as
NetRom and UIDIGI.

The header for U27 connects pins 2, 5, 15, and 20 together. Also
pins 9, 10, 12, 16, and 19 are connected together.

The header for U28 connects pins 2, 5, 6, 10,12, 15, and 19
together. Also pins 9, 16, and 20 are connected together.

These alterations hard set the unit for 4800 baud on the serial port,
1200 baud on the radio port using the VHF tones on radio port 1.

If you have an old 1278 or 1278T collecting dust, you can put it
into service as a UIDIGI.

73's,

Tim - N8DEU
Huntsville, Alabama

```
I'm afraid I'm just a bit confused over some weather information.

        I have county files (under winaprs/counties) for AR, AZ, CA, CO, KS, LA,
MO, MS, MT, NE, NM, NV, OK, TN, TX, UT, & WY.

        I also have the NWS Shape files installed.

        Yet, the following does not show on my map:

LUBSVR  NWS-WARN        DKVAA   26      04/13 14:31     132115z,SVRTSM,TX_C437,  SWISHER COUNTY
LUBSVS  NWS-ADVIS       DKsAA   10      04/13 14:56     132115z,SEVERE_WEATHER,TX_Z023,

        Am I missing something really basic here?

        Thanks,
        Earl

310. [aprssig] HTML help needed

From: Steve Dimse <k4hg@tapr.org>
Date: Sun, 14 Apr 2002 02:04:12 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74049-2002.04.14-01.38.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If there is anyone out there that is an expert on HTML I could use
some help. I'm working a new cgi that draws APRSdos maps:

http://www.findu.com/cgi-bin/dosmap.cgi?map=CABAK_LV.mp&scale=1.8&
offsetx=400&offsety=80&width=900&height=600

I want to have this working for the B2V event next weekend, and I'm
hoping to save time by getting someone else to wrap the HTML interface
around this cgi. I've never done anything with click-mapping, so it
would take me a bit to get this going.

What I'd like are radio buttons that select between center and zoom,
clicking on the image centers that map on that location and, if the

zoom button is selected, zooms the map as well. A set of radio buttons
to select a zoom level would also be nice.

If anyone is interested in doing this let me know ASAP...

Steve K4HG

County/Zone Files with numbers are obsolete- they have not been updated
in 2 years. you should have 9 files in your /winaprs/nwsshape folder.

```
c_22mr02.dbf  c_22mr02.shx  c_22mr02.shp
z_16mr02.dbf  z_16mr02.shx  z_16mr02.shp
mz21fe02.dbf  mz21fe02.shx  mz21fe02.shp
```

Your computer time, and time-offset in winaprs must be set properly.

Rendered body type: text/plain

Here is the update I promised. On Monday, April 8th, I returned to the Sioux City airport after being gone for 4 days. I fly a Turbine Commander that is based at a local Fixed Based Operator (FBO). The usual procedure is for me to drive the Suburban to the airplane to load it, give the keys to the FBO employees who drive it away from the aircraft, wash it and park it outside the secure area until I return. When I do return, I radio the FBO when I'm about 30 minutes out. They will bring the car inside the secure area and have it pre-heated or pre-cooled as the season demands. Usually they pull it up right beside the aircraft while I am shutting down.

This procedure was followed, to a point. As I left on April 5th I watched the FBO staff washing the Suburban as I taxied out. When I arrived back on the 8th I was surprised that the car was not brought out to meet me. I was further surprised when they told me they had no idea where the car was and that the keys were missing from where they stored them.

After arranging alternate transportation for my passenger the FBO staff and I search the airport just in case their staff had "borrowed" the Suburban to run and errand. Meanwhile the FBO called all the off duty staff to see if they had any knowledge of the missing Suburban. One employee report at, at about 0100 hours that morning he had heard a vehicle with a loud muffler in the FBO parking lot. As he walked out he saw two vehicles driving away. Once of them could have been my Suburban but one was definitely a van with a loud muffler. All other calls as well as the search were futile and the Sioux City Police were called.

Let me give you a few details about my vehicle. The Suburban was less than 4 months old. It had less than 5,000 miles on it. It was equipped with siren and 6 concealed strobe lights in the grill. It had not only my D700, but also a Tait2020 radio that was programmed with Marine (for US Coast Guard Aux. support), Civil Air Patrol and local law enforcement frequencies. My FEMA-USAR (Urban Search and Rescue) gear worth over $2,500 dollars, US Coast Guard Aux. Mustang survival suit and fire-fighting gear were all in the back as well as tool kits, and other miscellaneous supplies. When I put a pen to it the total came to over $6,000 plus $1,000 for the two radios.

After filing my report with the police, and arranging alternate transportation, I started for home. I was upset and mad. I stopped at a friends business to commiserate with him. Doug (KA0VHV) asked me if I had tried looking at FINDU to see if the tracker had been activated. I was dumbfounded. I hadn't even thought of it. We checked FUNDU you and, sure enough, there was one position report 13 hours old just South of the airport. We printed a copy of the map and called the Sioux City Police to report what we had found. The same officer who took the original report was there in minutes to look at the report. Since the position was outside the city limits she requested a deputy to respond to that location.

Doug and I then drove to the location to see what we could see. It was a gravel road that was right next to a boat ramp that accessed the Missouri River. Since the FINDU report had shown the vehicle was stationary when the report was sent we figured the vehicle was being stripped. We looked for discarded items in the ditch and farmers fields along but found nothing.

Realizing that it was past dinnertime I called my wife to tell her why I was late (she already knew about the theft). I told her where we were and why we were there. Two minutes later I received an excited phone call from her. She had been speaking with her brother (a deputy sheriff) and told him where we were. He got very excited and told her he had heard a license plate being run by a Conservation officer the prior night at approximately the same time but at the exactly the same place the FINDU report put my vehicle. Better than that, the 10-28 report came back to a known criminal that had just been released on parole and his vehicle had been involved in an accident resulting in a damaged muffler.

Since the vehicle report was only 100 yards from the river our first thought was it had been dumped in the river. The next day the Coast Guard Aux. started a search just off the boat ramp. The search was unsuccessful and plans to return with a sonar unit the next day were made.

Those plans were cancelled when a report that my Suburban had been used in a burglary 30 miles away was received. A witness to the burglary gave a description that matched the description of the van owner.

The search was on. It was now Wednesday. My brother-in-law (the deputy) spent his day searching the known hiding spots in the county as well as looking for the suspect. At 1400 hours his shift was over. At 1405 hours another deputy spotted the suspects vehicle with three occupants washing it. Suddenly there were three deputies and 5 city officers performing a "felony stop" on the suspects. I hear it was a thing a beauty.

The funny part
. it was only four blocks away from my brother-in-laws house
and he had spent the day searching 100's of square miles for these guys.

So, three meth-head dirtbags in jail. There are more suspects (how did the keys get from the FBO to the meth-head?) Items removed from my Suburban as well as items from other burglaries were found in the suspect's van. And, after a few hours of friendly questioning, my Suburban was located. All three were charged with possession of meth and theft in the first degree. Other charges are pending. The one on parole will have to go back to finish the nine years left on his prior sentence as well as whatever he is convicted of for this all these crimes.

The Suburban is in terrible condition. All radios have been removed. Light and siren controllers damaged beyond repair. Much of my gear is missing. The vehicle is bent and, in my opinion, broken. There is barbed wire wrapped around the drive shaft, corn stalks sticking through places I didn't corn stalks would fit. It has been nose-dived and I'm sure the front is pushed up. The side panels are dented and the paint is scratched off down to bare metal. Tomorrow the "discussion" with the insurance company begins.

I've asked for a drug sniffing dog to go through my stuff before I even remove it in case there is drug reside of the vehicle was used to transport drugs. I don't need that when I'm trying to get on an Air Force base and past their drug sniffing dogs.

So, while APRS did not pinpoint he exact location of my Suburban, it did establish the first link of a long and complicated chain. Without that link there would not have been a suspect. And without the suspect the police would not have know whom to look for.

The case was solved with plain good old fashion police work. APRS just got the ball rolling. My thanks go out to everyone who assisted. People even called me to suggest that I use FINDU not realizing that is what got the ball rolling in the first place. Everyone's heart was in the right place and I thank you all for that.

Dave

Subject: [aprssig] ADMIN: replying to this SIG

When you reply to a message on this SIG, the SIG software is set up so that
you end up replying to the person that posted the message. Your reply will
not be posted to the SIG unless you Reply-To-All or you add the SIG email
address in the TO: field of your message.

Is this the way you like it? Many other SIGs including two others I
administer are set up to reply to the SIG rather than to the person who
posted the message. Would you prefer this option?

Let me know if you would prefer to reply to the SIG or reply to the person
who posted the message. The majority rules!

73,
```

Stan and the SIG,

My vote goes for reply to go to the author and reply all to got to the sig. I have seen many flame wars started by "inadvertent" posts that were "intended to be private". Each post should require a deliberate action that precludes the excuse: "OOPs I meant for that to be private."

To reply to an individual would require a cut and paste operation that in the past few seemed to be willing to do. This has led to many problems and I think was one of the reasons the software was setup the way it is now..

Unfortunately, the current method also causes the inadvertent reply to private emails going to the sig because many people, myself included, use a different email address for mail lists. When someone replies to my list address instead of copying and pasting the email address in my signature, they risk me inadvertently replying to them via the sig because I did not recognize that their email was direct and not from the list.

So, the question is: Is the list primarily a discussion group or is it a method for direct contact. I vote for it being a discussion group and having standard replies go to the sig. If someone doesn't want to take the time to put an address in the To field of a private response, then IMHO they didn't intend to reply privately anyway.

Is anyone besides me getting the error message about "Error: improper settings" when trying to display a map location ?

I had not seen this before upgrading to the 2.11 version. Downgrading back to 2.10 did not resolve it either.

Thanks,
Walter/K5WH

Stan,

I'm in favor of Reply to the list, Reply All to the individual.

FWIW, I'm using Outlook from Office XP and Reply All brought up Pete's list address plus the group. Pete, is there some setting in your copy of Outlook that you may have changed? I'm racking my brain, but I can't think of it.

This sounds like a MapBlast error, is that what you are using to
generate the maps?

>I had not seen this before upgrading to the 2.11 version.
>Downgrading back to 2.10 did not resolve it either.
>
MapBlast has been messing with a lot of things lately. For a while my
global maps in the satellite and winlink pages were messed up because
one of the parameters FAM= which had worked fine as "mapblast" needed
to be changed to "myblast". Occasionally I'll see the parameter error
pop up now, but I haven't seen any rhyme or reason behind this.

All the direct MapBlast stuff is reversed engineered, there is no
guide on their web site. When I began findU I wrote and asked if it
was OK, and for documentation on the parameters, I never got any
response. They now have some licensing info on their site, but it
applies to how many of their images you keep on your server. With
findU, most images are requested by and sent directly to the users,
when I do get an image (for example plot.cgi without a geo paramter,
it is only on my server long enough to process, usually a tenth of a
second, so there are never enough to exceed their free limit.
Certainly they must be aware of what I am doing, I figure findU
appears in their referrer log a couple million times a month.

I would expect to have heard something if they had a problem with this
now, but it also wouldn't surprise me if some morning the ability to
generate the map images just disappeared. That is part of my
motivation for doing things like the dos maps and plot, breadcrumb,
and line cgis.

I can't recall the exact parameter name but, setting the callsign of your
home packet bbs as the parameter will allows the bbs to download [elicit]

any messages in your TNC mailbox that are addressed to go into the system
after the bss has forwarded to you. Depending on your sysop there may not
be a need to set this parameter, many don't or won't edit their scripts to
use TNC mailboxes, anyway FBB header broadcasts and Winpack/TPK/Sally are
the better way to do it . A word of CAUTION when MFJ introduced it's
"enhanced" mailbox a serious bug existed if your sysop forwards bulletins to
your TNC mailbox the mailbox gave the bulletin new BID and forwarded back
into the system. I don't know if the flaw still exists with later versions
but you can get around it by not setting the parameter or using a call that
wouldn't initiate a download.--73

I am for replying directly to the author for 4 reasons.

1)Many times the reply is intended to the original author and needlessly
goes to the entire sig.
2)It is a good "firewall" for the flames (pun intended) by needing to enter
the address manually,
  personal arguments quite often end up in a all out war here.
3)Even though it only takes a brief moment to enter aprssig@tapr.org that
moment may be all it takes to
  have the sender re-think blasting away in a moment of passion.
4)Yes, this is a open discussion list and a good one but "stop and think" is
a lesson to live by.
  We are all technically adept people, it is not difficult to enter the sig
address in a reply if we have
  decided that it is actually necessary.

I assume you mean with the APSA+SA Web Server?? If so, download the patch file, html.p211 which is for v2.11 and corrects the changes made at MapBlast. See the FTP site below.

Now that I have my vehicle back it is time to start looking at replacement
radios.

Is there anything out there new (or hints of something being released at
Dayton) better than the Kenwood D700?

I had used the Pharos I-GPS for $130 to feed the D700. Anything better that
I should be looking at?

Dave

Funny you should mention this right now.  I had been wondering about this
very issue the last few days (since you posted about the record number of
hits on Findu) .  "How much of a bandwidth drain on Mapblast is Findu?"  and
"Why are they willing to have all this  bandwidth taken without even any of
their banner ads being presented on Findu" ?

With the UI-View program also now able to take advantage of Mapblast maps,
via the Maptool accessory program,  and the web server built-into APRSplus,
the total APRS burden on Mapblast is growing!  When ARE they going to object?

1)  Where did you get the Pharos for only $130  !

2) Check out the Tri-M Systems "Smart Skymaster".  This is essentially a hard
mount version of the Pharos.  It is a combined antenna/receiver just like the
Pharos,  in a round package about 2 1/2 dia and about 5/8" high (looks like a
standard round patch antenna but a little higher).  It has a 3/4" stud
sticking out the bottom that inserts through a single 3/4" hole in the roof
like a Motorola-type antenna mount.  A single nut threads onto the stud from
below to lock it into position.   The center of the stud has a 6-pin
PS/2-type mini-din socket where you feed 5VDC in and take RS-232 NMEA 2.0
data out.  Mine is hardwired (through a 12VDC->5VDC converter) to the car's
electric system,  and has been running with a D700 non-stop for 6 months now
perfectly.

    http://www.tri-m.com/products/gps.html        (Manufacturer in Vancouver
BC)

    http://www.gpsoutfitters.com     (Their US distributer)

```
Hello:

I am running WinAPRS v 2.5.1 on a PI-100 with 64k mem and Win95. I am
getting a "out of memory in station list" when I am using the IGate feature.
How much memory is sufficient? Or what is the best way to manage memory.

Thanks

Bill, KC4OUA

```
In the WINAPRS directory, create a file called Memory.txt.
Use notepad to edit the file and in the file type,    STATIONS    8000

The space is a tab and the numbers are the amount of stations you want
to see.

I have this set to 16384 and I still get this type of crash, one or two a day.   As well as the frequent
 'terminating thread' error.   These bugs show up very quickly when the software is used as an I-gate,
due to the high volume of data coming in via TCP/IP.

I'm afraid the software is broken and there's little if any hope of repair.   Going backwards to an
older version didn't help either.

I wish the news was better for us.

My mailer (mutt) allows me to reply to either the sender, sender + all
cc: addresses or to the list, with different keystrokes (my keyboard
doesn't click on anything!)  Keep it like it is (I think there is a RFC
about this).

         I would very much prefer the reply to automatically go to the
SIG.  As it is, if I'm having a SIG discussion, I have to manually edit the
TO: line.

         Thanks,
         Earl

Personally for the sake of constancy in the use of the groups, email lists
and SIGS that I subscribe to, I prefer that reply go to the sig.  Even this
lists at qth.net are this way now. I'm using Outlook Express and I click on
reply all to the post of w8krr and the to field contains both w8krr AND tapr
aprs special interest group NOT only the sig as has been suggested.  I have
received email from mildly irritated persons who received duplicate messages
because I neglect to delete their personal addy from the to field.  True on
oops can start a flame ware but the war continues because others don't
expend the effort to end it.    In the end this is the small stuff and I
won't sweat the final decision but my preference is reply goes to the sig.
Doug, N0LKK

Here's what I posted to the aprs-spec reflector - it fits here too:

Reply to all - personal accountability and shared discussion outweigh
the potential for folks that don't yet know how to control their news
clients.

Everyone's gotta learn - sometimes with an embarassing motivator.

I think you said you have 64Mb on  a P-100.  I don't think that is sufficient.  My 56Mb machine will not
 handle a full TCP/IP feed, and it only runs APRS, plus the OS overhead.  Even with just local stations
(when the count gets up to 700 or so), I will
occasionally get out of memory errors.  The old machine had a motherboard limit of 132 Mb, and I was
```

afraid that even that wouldn't be enough, so that's one reason that I spent the money on a newer computer.

Also remember that the airport and zipcode.dat files and the NWSshape files take up lots of space. Getting rid of those could help a little.

>>>Too many people are too sensitive. I propose keeping it as it is (i.e.
>>>reply to the individual, reply-to-all for the SIG).

>>>J. B.

HA!   ***Too many people are too sensitive.***   (left-over ninties
"touchy/feely")

Websters Definition: <Sensitive> ... "Susceptible to the attitudes,
feelings, or circumstances of others. Quick to take offense; touchy. Easily
irritated."
____

As the father of three teenagers. (twin boys to boot!) I can see that the
possible reason for this ongoing problem in grown adult men may be the
left-over lingering emotionalism of late adolescence.

I say Change It!!   reply to the SIG!

Bill WB6JAR

I will keep accepting survey responses until they dwindle to nothing or
less. By the way, you can send your survey responses directly to me rather
than the SIG.

Stan, WA1LOU, SIG administrator

If I click on Reply All, my responses got to Stan and CC to TAPR
APRS Special Interest Group!

If I click on Reply, my e-mail goes to Stan _ONLY_ !

I don't understand what the problem can be,  I say leave it as it
is... Thanks

Robbie

Rendered body type: text/plain

```
Hi Folks.  I've got a web page I've recently put up which lists all the parameters the TinyTrak II
takes, and the values I/we recommend.  "We" in this case is the community at large.  Help me out by
checking out my page and letting me know if I've gone terribly astray anywhere, or if you have any
suggestions on making it better:

http://davidarush.com/tinytrak/

Of course there are many parameters for which there is no one right answer.  But I'm trying to provide a
 resource for the newbie, and want to provide a set of safe values for him/her to start with.

Smart beaconing is one area where I don't know a lot, particularly when it comes to the turns.  Can
anyone suggest some good generic values for newbies to start with?

While my page is targeted at TinyTrak users, I think most of the parameters apply equally well to most
mobile APRS users.

David, ky0dr

My choice is "Reply to All".

I can live with the flames, if I screw up and send a private reply to the SIG. It will encourage me to be more careful and will increase
the value of the SIG to me.

For those that would flame me for a mistake; they bother me not, for my mistake gives them a reason to live and me a reason to be
more carefull.

Pete/wa4hei

Eschew obfuscation.

Rendered body type: text/plain

Even though I am subscribed in Digest mode and this would not affect
me,
I agree with John's reasoning (copied below).

Keep the 'Reply' action to the originator of the post,
and the 'Reply All' action to the SIG.

Bob D.
N2IPH

---snip----
My vote goes for reply to go to the author and reply all to got to the
sig.
I have seen many flame wars started by "inadvertent" posts that were
"intended to be private". Each post should require a deliberate
action
that precludes the excuse: "OOPs I meant for that to be private."

To reply to an individual would require a cut and paste operation that
in
the past few seemed to be willing to do. This has led to many
problems and
I think was one of the reasons the software was setup the way it is
now..

snip

No, I do not like it! And, it is not a standard in any or all the email lists I am on or own. You can go way back to the Fidonet standards if you wish or now the Usenet NewsGroups. You are replying to a public message, which was intended to be on the list. If a list user does not wish to reply to the group(has a personal comment not intended for the public), then he has the choice. Otherwise, a reply to a group message should be to the group, period. That is the whole purpose of a group list.
To communicate, to share. Threads are very difficult to read when half the replies automatically go private.
For me, I do not like seeing two email messages showing up with the "Reply All".
And if the users wants private replies, they can request that in the email.
And if people insist on replying in private, then they have missed the entire point of an group email list.

I would like to suggest you keep messages to the group, group messages.
This is the standard.

Jim, WA6OFT

Since this is a SIG, replies should go to the SIG.  Many
replies that answer questions is probably of interest to
many in the SIG and they all lose out when answers are
sent just to the individual.

Maybe if you have to do extra to FLAME, it will
hopefully reduce that kind of response.

My web email system, (ATT) doesn't have a REPLY GROUP.
Only REPLY, DELETE, FORWARD.

I think the value of the SIG is reduced considerably
when answers to questions would help MANY others but
since they don't get posted here, the questions are
asked over and over again.  You can't even search an
archive for an answer since it never gets to the SIG.

Message-ID: <LYR842-74346-2002.04.15-10.08.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Since PCsat finally made it through one orbit without a reset over a week ago, it was able to remember its settings and stay in low power mode and to get a near full charge. It has been fully operational for over a week.

THus, we are removing the day-time only restrictions and returning PCsat to NORMAL OPS. This condition should last at least 2 more weeks. But since PCsat's batteries are aging, we ask that routine unattended ops still not be done after dark. Save it for the humans...

So you are welcome to use it, but with gentleness.. ;-)

I vote "leave it like it is."

I enjoy the flaming as much as the topics. It gives me an insight as to the character and mentality of the flamers and flamees. It puts a perspective on some things that I never thought of.

< humor>
Hmmm... Stan asked us if we wanted to change the method which we reply to
the sig... and he asked that we answer him privately.

that said.... I have seen no less than 6 replies on the sig asking that the
"reply" vs "reply all" be changed to just "reply" to reach the sig. BUT if
these people just hit "reply" their opinion would have gone straight to Stan
and not to the list. Instead they hit the "reply all" button copying the
list too.... makes me go HMmmmmmmmmmmm....

lol
< /humor>

Every 100 minutes. Passes are occuring from mid morning to dusk over the nrothern hemisphere. On any pass on one day, a similar pass will occur 30 minutes earlier on the next day. for about a week. Then add 100 minutes to get back in sync...

Not only are they using the REPLY ALL, they change the
TO to the SIG so we then get TWO COPIES of the message.

         At least in the case on the reply I sent, I originally set it to
go to Stan, but when replies started showing up on the SIG, I went back and
sent mine to the SIG, too.  It was not an accident at all, but a conscious
choice to send to the SIG.

Its built into every TNC but we dont have the power to support it, since connects are too wasteful of power. ALso commanding it all the time to OFF takes more power too. So we just ask people not so use it.

Subject: [aprssig] ADMIN: replying to this SIG

When you reply to a message on this SIG, the SIG software is set up so that you end up replying to the person that posted the message. Your reply will not be posted to the SIG unless you Reply-To-All or you add the SIG email address in the TO: field of your message.

Is this the way you like it? Many other SIGs including two others I administer are set up to reply to the SIG rather than to the person who posted the message. Would you prefer this option?

Let me know if you would prefer to reply to the SIG or reply to the person who posted the message. The majority rules!

73,

Stan, WA1LOU, SIG administrator

Why are you going HMmmmm? I assume they wanted it to go to the sig so everyone could see everyone elses reasoning. If they did it like I did, they:

Hit "Reply all"
Deleted Stan's name from "To"
Changed the sig address from "cc" to "To"

It would have been much easier to just hit "Reply"

That's why I'd like to see it changed.

But hey - lets go with the majority. I can live with either.

Just to let people here know...

If anyone you wish to contact on the list has Charter for email, they are out pretty solid right now. They went down yesterday morning at 3am for maintenance and haven't been able to get back up since. If you respond to someone on the list and see 'Charter' in their address (and there may be others as well. Pretty much a lot of the old HSA managed accounts I'll bet) they can send but can't receive until this is straightened out.

I am on a few lists over on Micaspeak(sp) where a "reply all" goes to
the list and the originator, while a "reply" only goes to the
originator. Works for me, I usually reply all.

..
No, I do not like it! And, it is not a standard in any or all the
email
lists I am on or own. You can go way back to the Fidonet standards
if you
wish or now the Usenet NewsGroups. You are replying to a public
message,
which was intended to be on the list. If a list user does not wish
to reply
to the group(has a personal comment not intended for the public),
then he
has the choice. Otherwise, a reply to a group message should be to
the
group, period. That is the whole purpose of a group list.
To communicate, to share. Threads are very difficult to read when
half the
replies automatically go private.
For me, I do not like seeing two email messages showing up with the
"Reply
All".
And if the users wants private replies, they can request that in the
email.
And if people insist on replying in private, then they have missed

```
the
entire point of an group email list.

I would like to suggest you keep messages to the group, group
messages.
This is the standard.

Jim, WA6OFT

Can we call it a "product" if it's free, and not even a loss-leader?

Xastir for Linux/FreeBSD/Solaris/MacOS X does _not_ support any
Davis weather stations.  I know 'cuz I've been into the weather
code a lot lately.

Rendered body type: text/plain

```
A friend of mine is just getting into APRS, and is operating (for the time
being) APRSdos on a laptop in his truck.  Unfortunately, he doesn't have a
GPS, so he is manually entering his position from time to time.

        Just as Bob Bruninga has described doing more than a few times.

        A couple of people on the radio yesterday (I won't call them hams) tried
to tell him he shouldn't be using APRS until he got a GPS.

        Would somebody like to explain to me just how someone OTHER than the FCC
can have authority to tell someone not to operate APRS?

        Thanks,
        Earl

The FCC gave these folks ham licenses ... *that* (in their minds anyway)
gives them the right to tell other hams what to do. I'm sure it's in Part
97 ... somewhere ... isn't it????;-)

I wonder how he gets his Lat/Lon without
a GPS unless he stops at bench marks.

Seems kinda inefficient.

No as efficient as a GPS .. but not too difficult. You look at the screen,
and put the cursor where you are, then hit (I think) F8   APRSdos then
sends out *that* position as your (new) location. It works best when you
are on a road or highway that is shown on the map of course.

388. [aprssig] Question - Using Garmin eTrex with Tiger Trak TM-1

From: "J.Duffy Beischel" <wb8nut@arrl.net>
Date: Tue, 16 Apr 2002 11:54:32
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74477-2002.04.16-12.28.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

John at Tigertronics informed me that he does not believe that the Garmin eTrex will work with their tracking interface since it operates on 3 volts only and the Tiger Trak needs to see a standard 5v at the serial port. Has anyone else experience this? Does the Garmin 12 v adapter drop the voltage to 3 v or is there an internal regulator inside the Garmin that puts it at 5 v and only presents a problem if the unit runs on batteries. Need an answer fast if he is to get it out today.

Thanks,

Duffy

Yes, because it is a product _of_ something. In this case, labor.

....but then again, that may just be a product of my imagination.

Well, I can't speak for other parts of the country, but around here
all the mobile trackers use a GPS.    Most popular is one called
trip mate.  I use a Magellan my own self.

They're used for special event support and SKYWARN
mostly.

I guess you could get out your topo map and get a coordiante,
but heck even soldiers these days use GPS and probably would
be as lost as a 2LT tryin' to read map  :-)

Also, requires you to use a 'puter while you're driven
which isn't safe.

Hi Earl

Not sure what the "other" hams basis for their discouragement of manual lat/lon entries are?
I'm sure they are "seasoned" experts trying to flaunt their "expertise".

Actually it sounds like they dont understand APRS themselves. That is one of the misconceptions
a lot of people have about APRS in the ham community when i talk to them. Many think they can't work
APRS without a gps, so they don't. I tell them to forget about buying a gps until you work the mode
on the computer. Of couse i cannot see anyone nowadays not owning a gps, but that is another topic.

Your right about the critics not being hams. Their actions are the type that run new people
out of the hobby. I know several new hams that got started in different RF modes and the so
called experts just drove them off with their negative comments.

If he knows his lat/lon manually, i see nothing wrong with that. GPS's are just a tool
and they even make mistakes. How many time have we seen hams at 00.00N/00.00E
off the west coast of Africa with a gps unit ;)

Encouragement and POLITE help goes a lot further than reading "Part 97" to them
right off the starting blocks. Just hope your friend does not loose interest. We were
all beginners at one time.

BTW, i am replying to ALL which makes sense to me, but then i'm not an expert ;)

regards

Randy Farley

AH, now that is a really cool feature.  Good thinking Bob.  You could do a
simular thing in APRS+.  You can tell it to capture your lat/long from Street
Atlas.  A round about way but possible.

    Having fried an eTrex Legend by feeding it 12V assuming
it would have an internal voltage regulator like its bigger
brothers, I can say that 3V is required. Don't give it more
than that.

    Matt (k4mls)

I don't know about the Tiger unit, but I can tell you the ETrex is 3v.  I
bought my son one for Christmas, and the car adapter drops to 3v.
(But to be ABSOLUTELY sure, I'd have to go check.)

I remember seeing some stuff on web pages about modifying some CD
player and phone car adapters to use with the ETrex and get 3v.

Mike

```
What if the only option you have is REPLY?  Then any
replies go to the sender not the list without modifying
EVERY MESSAGE.  All replies to questions/problems do not
show up on the SIG and are lost to anyone else that
```

would be interested in the answers without YET ANOTHER
question to the SIG for the same answer.

If all went to the SIG, you could easily change to the
sender. I would guess that most replies would be of
interest to others on the SIG and any that are not
SHOULD BE TAKEN PRIVATE.

I guess I did not state this very clearly.  The 3v power that the eTrex
uses, Tigertronics claims, does not provide enough voltage to the eTrex
circuit so that the signal output on the serial port from the eTrex is a
non-standard 3v and not 5v as the TigerTrak unit is expecting (and an
industry standard for serial connections so he says - heck I have no idea).
 As the standard for voltage on a serial port is 5v and therefore the
```

signal coming over the serial port is "not strong enough" to be able to be understood by the TigerTrak unit and hence it does not see the eTrex. The question is - is anyone out there able to use a Garmin eTrex GPS unit of any type with the TigerTrak unit? Did you have to do anything special? Is the TigerTrak unit able to see the eTrex GPS unit - especially when the eTrex is running on 3v battery power?

Tigertronics says it just won't work with eTrex. That some guy had a problem and that's what they attributed it to. I wonder if the guy that had the eTrex unit did not maybe use a null modem in-between because I understand that is what is required.

Hope this description is better than my last one.

Thanks,

Duffy

>
> Just as Bob Bruninga has described doing more than a few times.

Actually, this works very well if done properly. Here are the assumptions that make this work quite well. And it also might suggest why some client software operators DONT like it... when they see the guy on their displays.

1) Manually entered APRSdos positions automatically incorporate ambiguity based on the scale of the map used to enter the position. THus, his estimated positions should only show up as a circle of probability on everyone else's displays and not exact ICON's at precise locations (usually wrong).

2) Unfortunately, Some client software does not support this fundamental aspect of APRS and so those people see no difference between an exact GPS ICON and a 1 mile ambiguous position. But that is a problem of their own display software not conveying position ambiguity unambiguously to the viewer, and is not the problem of the sender.

3) APRSdos deadreckons the moving APRSdos senders position moving right down the highway. So although the sender only enters one posit at the start of his commute, on all APRSdos displays his 1, 2, 3, 5 and 7 minute following position reports will make him appear to move on down the highway (on ARPSdos). But those people with client software that does not automatically dead reckon will just see 5 different FIXED positions at the starting location and nothging else. Again, the error is in their display software, not the senders...

> A couple of people on the radio yesterday (I won't call them hams) tried
> to tell him he shouldn't be using APRS until he got a GPS.

If they are complaining because of what I guess above, then the problem is their display software and they should not complain to the sender, but upgrade their software to a model that works correctly...

But then these are only guesses as to things that "could be" wrong. I have no idea otherwise what they must be complaining about though I would be curious..

Bob

Maps.  As you drive along a highway, simply move the cursor to where you
are and hit ENTER.  APRSdos instantly updates you to that location and
reports that to everyone... including your course and speed.  And since
APRS is supposed to dead-reckon all moving objects, then the sender only
needs to do this when he changes course.  All the rest of the time,
everyone's maps are supposed to be moving the ICON along by themselves...

> Seems kinda inefficient.

But it always works, and doesnt need a GPS, or dangly cables, and can work
anywhere, including underground.... <grin>...

> simular thing in APRS+.  You can tell it to capture your lat/long from Street
> Atlas.  A round about way but possible.

Actually that is how APRS began!  We couldnt afford $1000 GPS's back then
so you just entered yoru starting location and CSE and SPEED to get you
to work.  THen your ICON would move on everyones screens until you got to
work.  I just set the staright line from home to work and an average
speed that would get my ICON to work at the same time I did.

As long as my commute was nominal, then my ICON moving on everyone else's
display and My real car arrive at work about the same time.  No other
inputs required.  In APRS, you only have to manually refresh your "input"
when you "change" your course or speed.

What constitutes a "change" depends only on you the sender and what you
want "receivers" to see.  I want them to see how far along I was to work.
The dead-reckoned moving ICON was just as accurate as it needs to be to
show that.  THe fact that I make a zillion little stops, starts, tunrns
and curves to work is meaningless to that objective.  THus, it wasnt until
the year 2000 that I finally put a GPS in my car.  ALl the rest of the
time, eveyrone could see where I was sufficiently for the commute at hand.

It wasnt until recently that I have discovered that only other APRSdos
users were actually seeing my ICON moving smoothly to work, because most
follow-on "aprs" software was not doing deadreckoning..

Geesh, next thing you know they'll have fits about people who play dummy
tracks to test!  (Or for other purposes...  Like the guy who found out his
ex-wifes attorney was asking a few HAMs how to monitor APRS, so the
guy set up his home PC to play a dummy track one weeked while he went
elsewhere...)

Not that we'd EVER do that to be deceptive...

Mike

I believe Industry spec is +/- 25v unloaded max, with a +/- 3v
swing under a standard load.  As long as the transmitter can meet the
+/- 3v swing under a standard load it should be fine.  And while not
to spec, most parts work if the signal goes to 0v, or close to it.  It's
just that the spec is 'undefined' in that window from -3 to +3.

As far as I know, there is NO spec that says it must be 5v.  Anywhere.
If I'm wrong, I'm sure a bunch of people will chime in.

There were a few TI parts a number of years ago that had some
weird issues if the swing wasn't balanced, but I don't remember the
actual problem.

Mike

Rendered body type: text/plain

I've used an Extrex with the Tigertrack. It will work
for a while, then it will all of a sudden lose lock
and start transmitting erroneous packets. It was like
the decimal in the Lat and lon would be transposed, so
my station would end up off the map. I attributed the
problem to the power, as the Etrex would be running
off the batteries. It seemed that as the battery
voltage dropped, I would have more trouble with the
GPS.

I don't use an Etrex on my Tigertrack anymore. I have
a GPS-35 that I picked up at a hamfest. It works
wonderfully with the Tigertrak.

As a side note. I use my Etrex on a AEA PK-12 and
never have any problems with it. I've also used it on
KPC-3+ without any problems, so this issue seems to be
isolated to the Tigertraks.

Does anyone have experience with using a PDA GPS unit with the tiger track
or for that matter with APRS applications?  I have a Visor "Neo" which I am
interested in using with a GPS/APRS application.  Magellan makes a GPS unit
for the NEO, but I can't get ayone to tell me if the cardle on the NEO sends
NMEA data to/from it.

HELP?

I am not sure about the serial port voltages on the eTrex, but the 12v
adapter does, indeed, supply only 3.0 or 3.3 volts to the eTrex.

>From what I understand, the eTrex doesn't even have an internal voltage
regulator and will be destroyed if you feed it any more that 3 or so volts.

However, it does advertise a RS-232 port. While the "specs" talk about +-10v
(or something even more)
swings, many devices get away with much less than that. I've not had a
problem connecting my eTrex's to Desktop PCs, Macs, laptops, TinyTraks or
PIC microcontrollers.

It's a good bet that someone else on the list has used an eTrex with the
TM-1 and can give some real, empirical answer.

Best regards,

Rendered body type: text/plain

We got it now (DR) in APRS+ and i love it. Now people who say, " I don't have a gps so i cannot play", have no excuse . Actually i forgot about this feature after i bought my first gps. I always showed this feature to newbies when i ran APRSdos to get them "jacked".

Thanks Bob for all the innovations. In fact,to all the authors out there, keep up the great work. It is really appreciated by me.

<snip>

It wasnt until recently that I have discovered that only other APRSdos
users were actually seeing my ICON moving smoothly to work, because most
follow-on "aprs" software was not doing deadreckoning..

Bob

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74528-2002.04.16-15.32.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have zooming and display of APRSdos maps working on the Baker to
Vegas page, as well as a table that calculates the position of each
tracker on the course. Of course, the results are a little strange
given that most trackers haven't been activated, and the active ones
are 100 or more miles away. I have a couple of test calls in there
with positions which fall on the course.

http://b2v.findu.com/

This APRSdos map implementation will only work on dynamic web pages,
(which means only I can write pages like this) so don't ask! I have a
volunteer working on a javascript implementation that should allow
anyone to add this to their own pages. Stay tuned...

Steve K4HG

```
These people that criticized the ham most likely use a
GPS and most likely have been using APRS for a while.
Your friend doesn't have a GPS unit now and probably
wouldn't need one otherwise. If this is the case his
sole purpose for the gps would be for APRS use. Those
people posing as the APRS Police probably don't
realize that this person is just trying out APRS
before he goes and invests in a GPS.

Or he could be saving his pennies to get a unit that
will do everything he needs and wants to try APRS
until then.

Yet another or!

Or he could be using it to communicate with a friend
or family members by sending messages. A valid use for
APRS. There are few truckers that go through my area
frequently and use it for that reason.

Someone said that his way of doing it might be
inefficient. It may be for tracking but for learning
more about APRS or keeping in touch with others it is
highly efficient.

OK, if this is the rule, all home stations and digits should be shut down
until they get a GPS connected to report their position that will never
change.

I hope this is not off-topic.

But it there anyone that could burn a copy of UIdigi firmware for me?  I
have a MFJ 1270 that is collecting dust and it needs to be used as a APRS
digi in the Mullins SC area.

Thanks

Lloyd KD4HTW

At 05:47 PM 16-04-02 +0000, k9soa@att.net wrote:
>What if the only option you have is REPLY?

If reply is truly the only method you have to send Email I think it is time to upgrade to an Email client that has an address book.

Just make an address book entry and use that, which is what I do to go direct to the list. My original comment was that the list was setup the way it is due to past problems. I have been subscribed to the SIG since the early to mid 90's and I remember several long flame wars over "accidental" posts. This has not been noted in most of the posts since. I recommend that Stan look at back archives and discuss this with some of the old timers at TAPR before any change is made. I subscribe to the theory {If it ain't broke don't FIX it.}

That said I am mature enough and competent enough to understand and use any system and will do so cheerfully. But to constantly "what if" is ridiculous. What if there is a nuclear EMP pulse tonight can I get a date with Jessica Alba?

Here is my working theory with explanation:

REPLY: to originator (good for answering routine information requests that don't need to be reposted)

REPLY ALL: originator and list (best for most replies of general interest since a sender in digest might have to wait for an answer I allow the post to go direct as well.

ADDRESS BOOK: (new posts and general interest replies not directed to a specific author)

The question should not be what is the "best" way for the list to work. Rather the question that needs to be answered is WHY was the list set up the way it is? If it was done for a reason is the reason still valid?

Ask five hams what is the "BEST" anything and you will get 10 or more mutually exclusive answers.

419. [aprssig] APRS High-Site BACKBONES

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 16 Apr 2002 20:31:40 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74572-2002.04.16-20.05.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRS is completely broken in many high populatrion areas. We must move on past the "single-high-site-digi" 1995 APRS concept. I posted this before, but here it is again. I also put this on a WEB page:

http://www.ew.usna.edu/~bruninga/backbone.txt

```
BACKBONE DIGIS                                                   WB4APR
-----------------------------------------------------------------------
                                                          16 April 2002
```

Its time to REPLACE those HIGH-SITE DIGIS...

In some areas of the country APRS on 144.39 is just plain broken. This is because local engineering of local networks has not kept up with growth.

APRS is a cellular concept and just like with cell phones, as growth increases, the size of the cells MUST GET SMALLER to maintian the same quality of service to the end user.

When APRS is brand new in an area, then a single digi on the highest site will give fantastic coverage. A few such high sites can cover half a state... but ONLY UNTIL THE CHANNEL is full. At that point these high sites MUST BE REPLACED with more-and-lower sites. These lower sites can still still see adjacent sites so that the local traveler can be seen in surrounding areas, but not over the whole state. Igates or Backbones are what provides connectivity out of the local area.

The HIGH sites must be silenced or converted to backbones.

Backbones act just like the internet does. That is, they HEAR everything, and they share EVERYTHING with all other very high sites (on a different frequency!). Nothing comes out of them unless it is needed. Here is what we must do:

1) Lets take California as an example since it has well clustered areas of activity. Lets also assume that the goal of a given 144.39 channel in any area is running at about 20% of channel capacity (The ALOHA rate). Thus on average, you could combine the data from up to five such high density areas into a single full-time 1200 baud channel (backbone) and pipe it anywhere you wanted (NOT back to 144.39).

Or you could combine the feeds from 40 such areas into a single 9600 baud full time feed... Users who feel that they must see EVERYTHING in those 40 areas all at once, needs to tune in this 9600 baud channel. But otherwise, he just stays on 144.39, a nice quiet shared channel in his area. He will see all activity in range and have worldwide connectivity just like he does now.

2) Or, since the only APRS traffic that needs to go elsewhere for delivery is MESSAGES, then have Backbones smart enough to carry all messages and then put them back to RF where the receipeint is (just like the Itnernet system). This system would also forward position packets for those involved in both ends of the message... Just like the internet does.

In otherwords, the IGate rule applies. Everything goes in.... But nothing comes back OUT into an area unless it has significance there. The present rules for "singnificance" are:

1) It is an incoming message for someone in this area
2) It is a position report for someone in QSO with someone in this area
3) It is somehow designated as special...

BACKBONE HARDWARE:

Someone sent me a link to some 386 embedded microcontrollers complete with 4 COMM ports, IDE controller, FLASH ROM etc on Ebay going somewhere between 10 and 30$ I think. With one of these cards and 2 to 4 KISS TNC's would make a nice BACKBONE engine... Here is one way to use the 4 ports:

```
COM1 RX 144.39 >--+----DIGI only N HOP pkts---+---> COM1 TX 144.39
                  |                           |
                  +----Feed everything----+---|---> COM2 TX UHF4
                                          |   |
                  +-------Loop Filter-----+   |
                  |                           |
COM2  RX UHF1 >---+----Parse for local--------+
COM3  RX UHF2 >---+----Parse for local--------+
COM4  RX UHF3 >---+----Parse for local--------+
```

Here is what the BACKBONE NODE does:

1) it DIGIpeats on 144.39 except that it ignores DX beyond N hops
2) It listens to its three nearest BACKBONES on their UHF Freqs
3) It feeds everything (dupe free) from all COMM ports to its UHF XMTR
4) It parses all UHF feeds for local interest packets and adds them to .39

Here is what users do:

1) They operate normally on 144.39. But of course we encourage short hops
2) THey can Message and see anyone anywhere that they are messaging with
3) THey can query and find out about anyone anywhere
4) If they individualy want to see EVERYTHING, they tune to their UHF LOCAL freq...

We have got to get on with RF BACKBONES on other frequencies. I may not have it all figured out here, but collectively we have got to move on beyond the 1995 concept of a single HIGH digi for APRS for high population areas. Think cellular. High site digis are BAD in high population densities... and diddling with the fundamental concepts of APRS does NOT fix anything... you have to make the cells smaller, and link them by smart backbones.

420. [aprssig] Consensus - eTRex works with Tigertrak Unit

From: "J.Duffy Beischel" <wb8nut@arrl.net>
Date: Tue, 16 Apr 2002 19:50:55
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74574-2002.04.16-20.24.52--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Well, from the messages I received, the eTrex will work with the Tigertronics TM-1 unit. Obviously, the eTrex needs good batteries or an external power source to be successful. Seems that Tigertronics is not that up on the capabilities of their own product. Trying to work with them to get a shipment sent out was a real labor. They cannot ship the same day as the order (they need to get with the 21st Century) and after several calls I decided it just wasn't worth dealing with them and cancelled the order. I ordered another TinyTrak unit from Byonics.

BTW, is anyone aware of any other GPS to radio interfaces besides Byonics and Tigertronics? Am I missing another product worth consideration?

Thanks to all that responded. Most appreciated.

421. [aprssig] Radio installation in recent BMWs

From: "Mark Conner" <n9xtn@cox.net>
Date: Tue, 16 Apr 2002 23:01:33 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74584-2002.04.16-23.35.41--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

I bought a recently-made BMW and it has the warning sticker on the inside windshield advising that operating any sort of two-way radio in it (incl. cell phones!) could mess up the electronics and also could void the warranty.

I'm wondering if anyone has installed ham radio equipment (especially 2m/70cm) in a BMW that has this sticker (I think any made in the last 4-5 years has this) and whether you've experienced any problems, sought help from the dealership, or whatever. Information on other makes might be useful to the list, but it probably won't help me with what I'm looking for.

Please reply off-list if you wish and I'll summarize what I get back to the list at a later date w/o attribution. No sense in documenting some things by name permanently in an archive.

Rendered body type: text/plain
```

```
Another question - did the APRS weather warning server go down
this evening?  We had some severe weather move through the area
and I didn't receive any warnings between about 0200Z and 0400Z.
Do all the core servers and AHUBs relay the weather warnings?  It
appears I was connected all evening, but it may have rotated
servers - I have 3 AHUBs in my list.

```

```
Bob,
I agree that there is a FINITE amount of bandwidth available in any "pipe"
in our case it is half of a 1200baud pipe (simplex).

The cellular idea does not entirely work if you are trying to cover X
number of miles and you have to WASTE too much bandwidth in all of the
CELLS to get to another area.

Here is my idea for improving the bandwidth utilization and improving the
coverage at the same time.
1. Drop the "cellular" idea and instead move to a "Tiered" system. This
would give the immediate benefit of backward compatibility wherever someone
traveled AND increase bandwidth.
A tiered system would have MANY smart relays that would in effect NOT relay
unless the wide or wider receiver/digi did not hear it directly OR from
another higher tiered digi.
Example: Using a Large City as a model with multiple inner and outer
freeway loops around the city with a N/S and an E/W freeway so that you
have pie shaped pieces as well. In each of the pie areas you would have
other digis. Since it is possible that MANY receivers hear the signal then
the lower tiered ones wait to see if the higher one hears it. If the packet
IS heard and repeated via the WIDE then the tier 2,3.....'s do nothing with
it. Any digi ONLY repeats LOWER or EQUAL level packets. A Tier 1 would
always repeat another Tier 1 packets (assuming idea 2 below is within it's
desired/designed area of coverage)
In the Center of town you have a Tier 1 Digi VERY HIGH and definately WIDE!
It can talk (High power/good penetration)and hear ALL the further away
digi's but at the same time cannot get good reception from low power mobile
stations. In the surrounding area you have Tier 2 and 3 digi's, A tier 2
digi would buffer and wait X amount of time until it could see if any Tier
1 digi repeats the signal heard. If the packet was not repeated by the Tier
1 then it would send the packet. Likewise the Tier 3 would wait until it is
sure that no Tier 1 or 2 station heard the packet.

The tiering MUST be done and structured in a PLAN/organized system of the area.

2. All digi's must be SMART. They should KNOW how many hops is reasonable
for a given area and only repeat packet within a certain number of MILES of
the packet heard.
(This solves the band enhancement issue as well as USERS deciding how far
```

they TRY to make there packets go.)
Example: If in a given geographic area the sysops decide that all packets should be heard for APPROXIMATELY a 100 mile radius then any digi (knowing it's own location) would only digipeat packets within that were within a 100 miles of that digi. (areas of coverage would of course change based upon system loading and the number of I-gates).
This removes the end USER from setting a path, instead path might be replace with a "requested" number of miles.

3. All digi's would also compress any non-compress packet on the fly for backward compatibility with older trackers but would only transmit compress packets.

4. All moving and weather stations should try to use "Smart beaconing" I don't know of any weather stations using any form of smart beaconing, but it should be developed by our weather guru's! (I am NOT a weather guy!) but weather packet frequency should occur more frequently when the weather is changing or a threshold has changed. Not just because "10 minutes has gone by"
So, A system that quits sending/relaying messages amongst lower digis, no longer transmits path information, and only uses compressed packets would GREATLY increase the efficiency without the need of backbones and increased number of channels.

Some of this work (path changing) is already implemented in DigiNed. But with the addition of compression and tiering I think it could further fix the problem (A major problem is that end users must decide currently what there path needs to be for any given area instead of the "locals" who know what it needs to be and what the impact will be and how many hops or radius the person needs.)

Mark Cheavens
KC5EVE
Houston area sysop of 3 wide digis and 2 more on the way.

Footnote: I currently use ONLY UIDigi code in TNC-2's in all wide digis. This combination currently offers the only TRUE method of supporting all path types without the potential for duplicate packets in a package that can be put a remote site without the fear of having to give the computer the 3 finger salute! For our Downtown Houston site I am about to HAVE to move to DigiNed to FIX people that insist on sending Wide7-7,Trace7-7 uncompressed weather packets every 10 minutes WASTING bandwidth. I don't CARE about the weather 200 miles away when it is NOT changing!

This is not news to most of us. It has been discussed here extensively and has been the subject of at least one QST article. BMW and Porsche both have had this warranty disclaimer for as long as I can remember (Mercedes Benz too, I think). AFAICT, the reason I think they do this is so that you'll be more inclined to have the DEALER install your cellphone rather than go somewhere else.

Just another reason to avoid buying either a new Porsche or BMW, IMHO. I trust German cars slightly more than British cars... ;)

These are disclaimers , that does not mean they are not liable.
Whould they sell so many large trucks ,taxis , fire trucks , police cars , with all that electronics in them? Disclaimers are disclamers. My two side cars have not broke yet either. Electronic problems can be desighned out. Otherwise we would not have the space shutle , or the Ham repeater on the ISS. Bosch has already fixed everything so far.

So what's wrong with British Cars? I s'pose you'll be trashing the new Mini
too. FYI its actually a German re-bake and very radio friendly. Many a
British car has gone on to win the hearts and devotion of lots of Americans.
Just look at the Land Rover, Jaguar, Triumph TR4/5/6, MG Spitfire to name
but a few.

IMHO you still cannot beat a mini painted in British Racing Green with a
Union flag painted on the roof.

Cool Britannia!

Mark, G7LTT

Mark & the Group-
Wxsvr was up all during the outbreak of severe weather last night.  I
know there are some connectivity issues that seem to be associated with
the general aprs servers.  If in doubt use the finger function to probe
the Wxsvr such as:
"finger *@wxsvr.net" returns the last message parsed (by alphabet) -
generally a volcanic ash advisory (WBCASH). If you get anything back,
the server is up.

In your case your local NWS office uses OAX for a callsign so
"finger OAX@wxsvr.net" would give you the last thing parsed for Omaha
"finger OAXSVR@wxsvr.net" returns the last severe thunderstorm warning

These return the whole message - adding a dot aprs returns the parsed
packets themselves so that
"finger OAX.aprs@wxsvr.net" will show you all the packets parsed for the
Omaha region since the last reboot.
There is no conflict between the NWS office names and the message types
so you can get away with
"finger SVR.aprs@wxsvr.net" to see all the severe warnings nationally.

I have used "finger all.aprs@wxsvr.net" to capture a file of the packets
and load them into winaprs as a log file- could be useful to get back up
to date after a reboot.  I plan to examine the database for expiration -
so soon you will only receive valid information via the finger function.
  If you are not familiar with "finger" it is one of the oldest internet
protocols- it actually predates the internet by a few years.

73 de kg5qd Dale

I came up with this idea in my aprsdigi dos program.  I called it "yeild"
digipeating.  If a taller digi had already digi'ed a packet, the lower digi
would yeild and not digi.  the hold up was a dynamic table in memory that
would auto sense the tallest (taller) digi's.  The PHG's are not too
accurate and some digi owners like to overstate their real coverage area.
```

> 3. All digi's would also compress any non-compress packet on the fly for
> backward compatibility with older trackers but would only transmit
compress
> packets.

I actually did this in the aprs digi. The problem here is that you convert a packet that is circulating then you'll end up with two copies and negate the duplicate checking that other digis do. Afterall, it is a different packet once it's compressed. The solution in this case was to only compress packets that were heard direct or via a "relay".

I also particularly like the german's flexnet system.... it hard enforces things like TXdelay. If your TXD is too long, the digi will tell you so, and reject your connect request. Something like that in aprs would be a godsend.

Wes

Rendered body type: text/plain

> > The HIGH sites must be silenced or converted to backbones.

Now here is an easy overnight cold-turkey phase-1 approach.... Leave these digis in place, listening on 144.39 but transmit on UHF. I call these HIGHx sites.

HIGH1: 1 RX on 144.39. Everything it hears it transmits on UHF.
HIGH2: 2 RX on 144.39. Beams point to each valley on either side
HIGH3: 3 RX on 144.39. 3 directions covered with narrower beams
HIGH4: 4 RX on 144.39. 4 directions covered with low tower leg beams

Notice the INSTANT advantages of these HIGHx site conversions:

1) Factor of 2, 4, 6 or 8 improvement in throughput and reduction in QRM. First a factor of two because each HIGH digi is now operating cross band full duplex. So it is not adding to channel QRM. Additional factors of X because each site has X multiple receivers.

2) Notice that even for the HIGH4 digi, the output can still be 1200 baud! Since the ALOHA saturation rate is on the order of 18%, then that means 5 such channels can all be heard at a HIGH4 site and fed into a single 1200 baud UHF transmitter without saturation.

3) Instant gratification in that this is still just a DUMB digipeater, and no software, firmware or anythign has to be developed. ALthough I think DIGI_NED software on an old PC may be required for the multiple ports.

4) Regional IGates simply listen to the UHF output of their HIGH digi so they can still hear everything, just like what the HIGH site hears.

5) FIxed stations or mobiles desiring to see everything the HIGH site is hearing can also just tune in to the UHF output for their area. They still transmit on 144.39.

6) Coordination (other than to get a UHF freq) is not required. The HIGH sites only listen on 144.39, so they cannot add to QRM on 144.39.

USERS: Users may think that they are being cut off. But this should not be the case. What it does is eliminate all out-of-area QRM from their area so that now they CAN hear their "local" low area digi. They can hear the HIGH stuff any time by tuning in the UHF downlink.

Now LOCAL areas can gain BACK some control over their 144.39 LAN by installing their OWN low-area 144.39 digis for their area of interest. These digis support the APRS universal RELAY,WIDE and WIDEn-N so that APRS gets back to working like it is supposed to. A few hops through these low digis should cover quite an area. And everything gets into an IGate somewhere for FINDU and all the other magic of APRS...

This will give us a year or two of breathing room to develop any higherorder backbone logic that would then LINK the HIGH's together.

For HIGH2,3, or 4's, remember, that you dont need sensitivity, what you need is DIRECTIVITY. SO you can run 100 feet or RG58 if you need to one beam on one side of the hill (low down) and then another cable to the other side of the hill at the base of the tower so that both independent 144.39 receivers do in fact hear two different areas at the same time.

Yes, they will hear opposite side signals too, but they should be 10 dB or more weaker and that is all you need for FM capture effect. These directional receivers are NOT intended to hear mobiles, but only the cluster of LOW digis on that side of the hill. The multiple low digis are supposed to hear the mobiles and they CAN because they are no longer QRM'ed by bazillions of other cross state traffic on 144.39.

It would be fun to sit down with a TOPO map of SOCAL and look at each HIGH digi and figure out whether it needs to be a HIGH1,2,3 or 4 site...

In summary, GET CONTROL OVER YOUR LAN.
1) Shut down the XMTRS of the high sites
2) Convert them to crossband outputs on UHF
3) IGates listen to the high site UHF outputs
4) Start installing more low site RELAY,WIDE,WIDEn digis

Just a suggestion. Again, this only applies to HIGH site digis that can see LARGE population densities. It does NOT necessarily apply to HIGH site digis in remote areas. Each area needs to design to TOPOGRAPHY. Every site is different.

If I remember correctly, Mike is almost right. Mike is right in that there is no standard that is for 5v serial RS232

I sure that the spec for RS-232C requires +/- 1.5vdc to +30vdc. The 3-vdc 'dead-band' centered around 0-vdc is 'undefined', neither mark nor space values, and is considered 'noise'. 0-vdc is noise.

The problem for designers was that it wasn't easy to have dual pos/neg supplies, convert 0-5vdc TTL levels to the pos/neg signals for RS232, and invert the signals from TTL to RS232.

One chip pair that helped was Motorola's MC1488/MC1489 pair, which did the inversion/conversion but still required dual power sections.

Years later, Maxim made the Max232 chip, which had its own neg supply section, and the inversion/conversion, and transmit/recv on the same chip. Big improvement.

Some designers 'cheat' on their products by using an inverter only, and expect 0-5vdc to work. Sometimes this works, others it won't, sometimes the inverter blows up when connected to true RS232 devices! One area I've noticed with 'cheating' is that it worked usually in TTL, but as the HC chip line came out, this didn't use the same voltage thresholds for 'on/off' and many designs upgraded to the HC chips quit working. Some still worked OK with the HCT family, which sorta kept the TTL thresholds rather than the HC mid-supply threshold.

Some designers have tried to make their serial ports work with both 'legal' and 'illegal' values to cover both situations, but this is more uncommon.

You might be able to use a Max232+inverter and get non-standard ports to

```
work happily...

Bob,
Once again your idea will work...IF you have terrain to get the isolation.
In the Flat Lands we don't have that "luxury". I say that tongue in cheek
since I also know the problems it can create!
On a 500 ft tower that has EQUAL visability in all directions we will not
see the type of isolation you are seeking.

Big Cheshire Cat grin..... you do realize that would put 75% of APRS'ers off the air, don't you? (i.e. the ALINCO/KENWOOD TNC LID defaults).

Then again, maybe that would be a godsend and we'ed get people, and more importantly the manufactures to give a darn about level one. Could easily double channel capacity with your suggestion at no cost.

I have the opportunity to acquire a Sony Clie T615C for work. I have been trying to find out if this device has a serial port that would be compatible with Pocket APRS but to no avail. Except for a footnote on http://www.sonystyle.com/vaio/clie/615_specs.shtml the Sony web sites and online manuals only talk about a USB interface. Does anyone know if a serial interface really exists?

Brian

Why not? I have been using mapquest for my GPS reads when I did not have a GPS. What difference does it make if you dont have a GPS to get the reading from? Smack the person that told you that you need a GPS to run APRS and keep on doing it. If you have a station up and running that helps all of us.

I agree.  When I say cellular, it is kind of a tiered approach I
visualize.

> A tiered system would have MANY smart relays that would in effect NOT relay
> unless the wide or wider receiver/digi did not hear it directly OR from
> another higher tiered digi.

But this is not really the problem I was addressing.  This appraoch still
assumes there is enough bandwidth to support everyone from the high site.
In LA, this is not the case.  Even with perfect synchronization, no dupes,
and smart paths, you cannot stuff it all onto one WIDE.

> Example: Using a Large City as a model with multiple inner and outer

Yep, this is a good model for medium sized cities can still support
everyone from a single central WIDE...

In using California as an example, please don't forget the unique nature of
our great state. Yes we have enormous, huge centers of population, but so do
we have vast miles of almost no population with major highways running
through them. Some of these areas have no APRS coverage except that provided
by very high level digis. California's US Hwy 395 which takes millions of
skiers, hikers, fishermen, and campers to the High Sierra's every year has
NO coverage from the Ridgecrest area to the Nevada State line. A distance of
almost 400 miles, which by the way has no less than 3 ham radio clubs that
have not elected to get with APRS. (Time to send some more e-mails out.)
Some highway level "relay" stations would be helpful here but would still
require something around 8,000' to get out of the Owens Valley into the
network. Yeah, forget about ADSL service for an Igate here!
I like the backbone idea but haven't wrapped my mind around how it might be
implemented without starting a big war between all the Digi owners groups to
make it consistent across all the different areas.
Keep the great ideas coming Bob!

If I assume that you are in a flat area, yet do have the total 144.39
saturation problem of a major metropolitan area, then there is no reason
it wont work just as well there. Put three or four beams pointing in
different directions and if they are at least 4 elements or so, then
most of the signals coming in from a favored direction will be 10 to 20 dB
stronger that signals coming in from the other directions.

No matter how you look at it, the front to back and front-to side ratios
combined with the FM capture effect and separate receivers (and TNC's) on
each antenna will resoplve MOST collisions that currently simply result
in QRM and lost packets. Dont be affraid to add attenuation as needed so
this central HIGH digi only hears the surrounding other digis you
want it to hear, not DX low lwevel QRM or other trash...

No, none of them will hear a quiet channel (but it doesnt need to, because
now it never transmits on 144.39), but during collisions, each receiver in
each favored direction will capture and decode the packets in its
direction most of the time independently of what the others are hearing..
Of course the UHF transmit side then has to do DUPE checking so that only
one copy goes out when all receivers hear the same packet...

Yes, perfect example. For the digis out in the wilderness, then they
remain normal digis, but for the ones that are at the POPULATION end, then
those HIGH digis need to have BEAMS up there pointing AWAY from
the population centers so that any packet coming in from the wilderness
will capture the receiver over all the local population QRM.. These same
digis can also transmit back on 144.39 beamed back in the wilderness
direction too. while a UHF frequency can still combine what that site
hears from other directions on 144.39 as well...

I am seeing simular issues in the DFW area with channel saturation. A
backbone idea has been crawling about the back of my mind too. TexNet does a
very simular thing, so does ROSE. The cost to build a backbone will not be
trivial though.

Why has this issue popped up? IMHO several reasons. 1) Improper useage of
unproto paths is still serious. 2) Beacon rates too often for fixed stations
and mobile stations not moving. 3) txdelay to long is sometimes an issue. 4)
generic digipeat paths on WIDES and RELAYS. I have seen many a digi with
WIDE4-4 instead of specific paths. 5) KPC3 ver 8.2 does have a bug that does
not always prevent the duplicate packets (this is not as severe).

There may be other reasons I am missing, but things are getting very crowded
in some areas.

448. [aprssig] Updated The Netherlands Pocket APRS map + new map

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Wed, 17 Apr 2002 20:49:08 +0200
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-74712-2002.04.17-14.23.30--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello All,

For your information.

I updated the PocketAPRS map for The Netherlands which is also usable with APRS/CE, Xastir, MacAPRS 3.5.2 and WinAPRS 2.5.2 (Haven't seen this one released yet, Keith tested it a few months back) or better.

The map for The Netherlands now has labels! It also has a higher granularity which means that at deep zooms less line segments are lost compared to the previous map.

Because I have a Palm IIIe with only 2 MB memory and I will visit Belgium in the summer, I also made a new map for Belgium. This part of Europe was already covered in the map for Germany but this dedicated map is obviously a lot smaller.

You can find the updated and the new map, with other maps, on:
http://www.homepages.hetnet.nl/~pe1dnn/
(You may have to reload the map if you have a cached copy).

Kind regards,

Henk.

Rendered body type: text/plain

This is something that I had brought up MANY years ago but was dropped. I have long thought of APRS needing a backbone and even tried stirring interest in the mid 90's for one reason, coverage. By using a backbone system we could employ as has been mentioned beams, high power, and other bands (heck even a old analog MW spur)to link WIDE digi's over long distances.

I spoke at great length with Tom Molton W2VY the author of ROSE about this and some APRS code was actually written for ROSE switches (the BTEXT and UI Digipeating capability)but soon after Tom moved, changed jobs and I think dropped the ROSE project entirely. I am not sure who is responsible for the code right now, I think it may be a club in Tampa.

Yes it would be expensive to build a whole backbone network but not if we would try to make use of ROSE nodes that are already out there and possibly gathering dust. Regular packet has died quite a bit in some areas but not all. A 144.39 port could be added at existing ROSE switch sites and use the EXISTING backbone network. Florida had/has quite a bit of ROSE and some WIDE sites also have ROSE already there, it is just a matter of the software.

Last conversation with Tom W2VY was how we would do addressing to have the
APRS packet exit out the proper port at it's final location using the
current APRS protocol without modification. This was in 93' or 94' maybe it
is time to look into this possibility again.

In a topography like we have in FL where high for us is a 1K foot tower and
population density is in pockets along the 2 coasts with little but swamp
and gators in-between we need long paths. Areas now split like Miami and
Orlando, or West Palm and Tampa can usually only converse via the Igate or a
band opening. A backbone could possibly resolve this issue.

O.K.; I'm MISSING something here:
If the orbit of PCSAT is supposed to be every 100
minutes; why is it that it hasn't been heard over North
America in over THREE HOURS?
If someone is going to mention the solar activity, I was
under the impression that sats were NOT supposed to be
adversely effected by this.
(of course I COULD be WRONG; Daaaah)

> America in over THREE HOURS?

The orbit is every hundred minutes, but your particular spot on the earth is only under the orbit about 6 or 7 times a day. The orbit is more or less a fixed circle in space, but the earth rotates underneath it. Thus you are "under" or within view of the orbit only about 7 or 8 hours a day total. Usually this is when you are on one side of the earth and then again 5 to 12 hours later when you are under the orbit on the other side of the earth.

Thus, for typical USA station for a polar satellite like UO14 and AO27,, you will see about 3 passes, then nothing for 12 hours and then 3 more passes as you go under the orbit on the other side of earth. But PCsat's orbit is inclined at about 67 degrees so for southern USA stations, you will see about 3 passes, then nothing for 6 hours then 3 more passes.
If you live in the Northern USA, then you may see 6 passes all in a row, and then nothing for 16 hours...

Bob

Rendered body type: text/plain

Just wanted to drop a note to let you know of a few things I'm setting up for the Baker to Vegas relay race this weekend April 20-21. First of all, a javaAPRS monitoring page has been setup (www.ahubca.net/bakervegas.asp) for purposes of monitoring the race. Connect directly to that page and watch the runners creep along the course!

In addition, I am working the race as communications guru at Checkpoint (Stage) 13. I will have an APRS setup for spectators to monitor, and I will also be setup as a RELAY digipeater. I will use the tactical call STAGE-13 and will digipeat direct into W6KRW-2 (or N7ZEV-1, barring any controversy). I will test several paths to make sure I make it into one of the 4 neighboring IGates (WA6OFT, KF6HJO, AD6NH, and N6EX-3). If your trackers are not hitting the digis direct, set your path to RELAY and I will pick you up.

Enjoy and be safe! 73s

```
The response to the ³reply survey² has trickled down to less than none, so
the survey is now closed and the results are, as follows:

By a 2:1 margin, the folks responding to the survey prefer that replies go
to the list. Therefore, I will change the settings of APRSSPEC, APRSSIG, and
HTAPRS to reflect the results of the survey immediately..

By the way, the other TAPR SIGs I administer (APRSSAT and MIC-E) already
send replies to the list.

Stan, WA1LOU, SIG administrator

>This is something that I had brought up MANY years ago but was dropped. I
>have long thought of APRS needing a backbone and even tried stirring
>interest in the mid 90's for one reason, coverage.

This might be something to try out 802.11 with.  Using the existing IGATE
software mechanisms over 802.11, it might be possible to trivally bridge
communities...

Has anyone actually tried to configure their network per Bob Bruninga's
recommendations?  Correctly balanced power on the WIDEs in concert with mid to
lower power relays with good ears would probably help to mediate some of the
issues that really loud wides create with saturation of wide areas for long
periods.

Rendered body type: text/plain

```
Sooooooo.........

        I have downloaded the NWSshape files and installed them in the
c:\winaprs\NWSshape directory.  That directory shows the following files:

        c22mr002.dbf    c22mr002.shp    c22mr002.shx
        mz21fe02.dbf    mz21fe02..shp   mz21fe02..shx
        oz28se01.dbf    oz28se01.shp    oz28se01.shx
        z_16mr02.dbf    z_16mr02.shp    z_16mr02.shx

        That IS how they're supposed to be, right?

        The following messages have arrived here at my station:

LUBSVS  NWS-ADVIS       I0pAA    4      04/17 18:52     180130z,SEVERE_WEATHER,TX_Z038,
LUBSVS  NWS-ADVIS       I1LAA    6      04/17 19:22     180200z,SEVERE_WEATHER,TX_Z032,
LUBSVS  NWS-ADVIS       I1qAA    4      04/17 19:53     180215z,SEVERE_WEATHER,TX_Z026,
LUBSVR  NWS-WARN        I23AA    2      04/17 20:04     180230z,SVRTSM,TX_C269,  KING COUNTY
LUBSVS  NWS-ADVIS       I2BAA   12      04/17 20:12     180215z,SEVERE_WEATHER,TX_Z026,

        And yet, using the "New Map Square" function, I STILL don't see any
warning areas.

        Can anybody tell me what the problem is here?

        Thanks,
        Earl

Rendered body type: text/plain

```
Forgive in advance if this has been covered before, I tried to search the
archives to no avail.

I'm running WinAPRS 2.5.1 using a soundcard with AGWPE and a RigBlaster.
Understanding that the unproto path needs to be specified in a file named
AGWPE_Local.prt, I plugged in my desired path as
Path <tab> NA1SV-15,WIDE3-3

When I look at what is transmitted, it *appears* that the path is being
truncated (shortened) to NA1SV-15,WIDE3

I've changed it to RELAY,WIDE3-3 and this is transmitted without being cut
off.  Has anyone using a similar configuration had this problem?  I'm
assuming that a path of WIDE3 is not going to have the same results as
WIDE3-3

Any light shed on this would be appreciated.

         Yes, I've noticed the same thing.  I believe either the
AGWPE_local.prt or else AGWPE itself has a limit on the number of
characters that can be in the path statement.  Unfortunately, when you find
that limit, it's usually after sending with the wrong path for quite a while...

Hello everyone.  A long awaited update has occured on the credit list page and
the status page.  A nice suprise waits everyone.  If you are planning to send
in a donation, please do so before April 30th.  After all checks clear, we
will be ordering the server from Dell.  Due to the amounts we have onhand and
the outstanding pledged or in the mail amounts,  Several "upgrades" will
occur.  Make no mistake, the onsite, next day warranty will be purchased
.When we place the order for the server, I will post on the status page its
hardware.  I am reluctant to issue any sort of time table at this time since
I do not know when all the checks will clear and how long it will take Dell
to build the server.  I am going to wait one week after April 30th for any
delayed mail to arrive.  Most of you should start to see checks clearing by
April 27th.  The DCARC treasurer is processing all the checks DCARC has
recieved this week.  When I get a copy of his list, I will post the offical
ammounts.  Please look over the credit page for any typos, missing calls or
incorrect info.

Thanks guys, for the replies concerning APRS on HF..

So far I've not had any success with the freq's suggested but I'll keep
on tryin'. I suspect this is due to my rather crude facillities, is
that how you spell facillities? I only have an "Olde" Yaesu FRG-7700
receiver and am using an ancient Digicom modem, which was designed for
the old Commodore C-64. Works great on VHF. It does function on 300bd as
I have copied other HF packet, just no APRS.

Freq's suggested, so far are, MHz:

10.149, 10.151, 14.105, 14.105.5 and 18.100.

Earl & the Sig-
I did some experimentation this morning and discovered that if you don't
have the County Warning Areas shapefiles loaded, you don't get all the
counties to light up. Current zip is available at:

http://isl715.nws.noaa.gov/mapdata/newcat/amdc/wsom/w_30nv01.zip

The CWA were originally needed for the Severe Weather Outlook (SKYWARN)
notices-- which have been moved to message groups.

Hi Jay,

Yes, that is a very annoying problem and one of the reasons I stopped
using WinAPRS. You can not do anything about it until the Sprouls decide
to fix it. Path lengths can not exceed 14 characters when you want to
use the AGWPE.

I reported this problem to them (and on the list) in July last year and
I'm sure others have done the same, probably even sooner than me. It is
a very trivial fix for them and they could have made an interim release
available. At least that would have shown some responsibility to their
paying customers. Especially since correct path settings are so
fundamental to APRS it should have been a priority to them.

If you plan on using AGWPE with a path setting other than WIDEn-N, don't
bother plunking down $60 for WinAPRS, go with UI-View.

73s,

Hello Again:
I don't know how well callibrated your receiver is, but
the frequency I stated, according to MY radio
(IC-706MKIIG)is 14.105.5LSB.

When I lived in Tokyo, I found a BBS on 21.103 or so.
It is DU9DX I think. You may like to tinker around with
that.
Also, there is a DX CLUSTER on 10.139 or so, if you're
interested in that sorta' stuff.
Of course, I have been back in the USA for about 3 years
now, so not sure if ANY of these are still active.

> HTAPRS to reflect the results of the survey immediately..

Unfortunately, I fear, your results may be completely ambiguous. REPLIES
already go to the list, so I dont see why you have to change anything?
When I hit REPLY, my mailer asks REPLY-TO-ALL and if you just hit ENTER
then it replies to the SENDER and to the LIST automatically.

THus, My vote for "REPLY to LIST" was a vote to LEAVE IT THE WAY IT IS...
But apparently it was counted as a vote for change?

> By the way, the other TAPR SIGs I administer (APRSSAT and MIC-E) already
> send replies to the list.

I just went and checked and those SIG settings are NOT DESIRED. WHen I
hit REPLY there, my mailer asks me "Use REPLY-TO ADDRESS" or SENDER?
This now is totally ambiguous, because now I have to stop and go back and
READ the entire ADDRESS list to see what is in the REPLY-TO header. Only
then can I answer the question properly. This unnecessary cognitive
step is COMPLETELY an impediment to rapid and efficeint emailing

The way APRSSAT and MIC-E are set up is NOT the way to do it...

I retract my vote and was confused by the question (or was too stupid to
figure out the real underlying queston in the first place)...
I wonder how many others who said REPLY-TO-LIST were saying LEAVE IT THE
WAY IT IS...?

de WB4APR, Bob

It does NOW, before the 17th or so, replies went to the original sender. As proof, select a message from a week or two ago and reply to it.

It works very well in Eudora, and I suspect most other mailers. I have no idea about Pine, but I know I occasionally receive some stuff from various people using Pine and I can't always read it. It makes me suspect Pine does things a bit differently. I'm assuming you still use Pine, right?

>I retract my vote and was confused by the question (or was too stupid to

It's always your privilege to change your mind, but I'm not sure another recount is necessary. <G>

Now it's broke...

If I hit reply, it responds to the list.

If I hit reply all, it sends THREE copies to the list.

NOWHERE does it respond to the individual poster. I have to manually
enter the address. (Yes, I had to 'cut and paste' your address in Stan.

Sorry, but that's kinda busted. It may be good for antispamming, but
since the email address could be gathered from the body anyway...

Well, it's been fixed till it's broke.

Mike

Rendered body type: text/plain

It seems early this week a worm let loose. I got a FLOOD of emails (17
on wednesday alone) that were all of the same type. "Congratulations!"
or "let's be friends". All had 'suspicious' attachments. (However, when I
saved off some of them and ran this weeks update from Noron against
them, they passed. I still blew them off.)

The only reason I'm sending this to the list is about 1/3 of the email
addresses
came from people I recognized as from this list. But when I tried to
reply
to say "You sent me a virus" I got postmaster errors in about half the
cases.

Doesn't that mean that the viri didn't really come from the people on this
list, but the emails were disguised to appear as if they did?

Im not sure what you mean. When I hit REPLY, the reply goes to BOTH the
sender and the list, the same way it has for the last 8 years that I can
remember... I have to manually tell it not to reply to the list.. If all
this hubub is because the senders dont like getting a DIRECT reply (dupe),
then I think this is no big deal and not worth a change...

Yes, not everyone uses Eudora..

Apparently then EMAIL systems are not consistent, so then the survey
appears to have been worded to mirror only the result of the Bill Gates
majority... hummh...

I adapt and evolve...

True, but if you have a list of keps from the
ARRL, for example, and you don't know the
object number. Just scroll down to you find
the name (NO-44 in this case) and you will
see the object number.

To me, rememberin' NO-44 is easier than 26931!

OK, I guess we all need to include in our comments what kind of system we are using, or our comments are hard to correlate. Here is the NEW RESULT using PINE. These are my keystrokes and the result:

```
R  => "include original in reply? (y/N)"   (default is no)
Y  => "use REPLY-TO or SENDER?" (I have to go back & read the address list)
R  => "Reply to All? (y/N))"
Y
```

so now I have an added step and I have to cognitate and read the address list to see who's reply to it is going to. Many times individuals also have REPLY-TO addfresses, and so you HAVE to read all the addresses to see what the heck REPLY-TO is going to do. I dont like this added cognitive step... but PINE may be a minority...

Bob

Mike, I guess that is a mystery of life, I got one like that
and just deleted it. Came from someone named Dan
and I don't know a Dan so I just hit the ole delete key.

Many EMails I get that are really ads come from bad
EMail addys. I always reply to a spam with the spam they
sent me with a impolite cussin out and a bunch bounce.
I wish they would get them, but such is life in the cyber world. :-(

Subject: [aprssig] Did a worm hit the membership yesterday?

It seems early this week a worm let loose. I got a FLOOD of emails (17 on wednesday alone) that were all of the same type. "Congratulations!" or "let's be friends". All had 'suspicious' attachments. (However, when I saved off some of them and ran this weeks update from Noron against them, they passed. I still blew them off.)

The only reason I'm sending this to the list is about 1/3 of the email addresses
came from people I recognized as from this list. But when I tried to reply
to say "You sent me a virus" I got postmaster errors in about half the cases.

Doesn't that mean that the viri didn't really come from the people on this list, but the emails were disguised to appear as if they did?

Mike

This is a user interface issue, sounds like Bob's email app is like mine, it replies to all, and does not have the option to reply only to sender. For those of us in this boat, the recent change is a large problem...

I did not make a vote because my mailer always relies to all, and I delete those I don't want, so I thought for me the result would be the same. It is not however, I cannot send a private message to the sender without opening the header and cutting and pasting. Since most of my responses are just to the sender, I do not like this.

I think given this unexpected result Stan should hold another vote...

This is the W32.Klez.H@mm virus. It's a real nasty one and is spreading
rapidly.

Robbie Robertson <mwrobertson@attbi.com> wrote:

>Well, I too am disappointed, I use Netscape and when I clicked on
>Reply before, it went to the sender only.. When I clicked on
>Reply to All, it went to the sender and the Sig..

An additional benefit of the old (and should I say proper) method is it caused one to pause and think.... do I really want to say what I am saying to the public list or just to the sender? Most mailers (Bob's excluded) when you hit reply, only reply to the sender, or what the X-mailer claims is the reply-to address. So, in the past to send to everyone on the list, you had to hit "reply-all".

All this is going to do is lower the S/N more and these polls are meaningless anyways. The moderator should just do what he thinks is best as you'll never please everyone and no poll is perfect. I think all he has done is increase his workload as the list is going to see more traffic (as stuff that could/should be private will now be to the list).

>It should not have been changed to this method.. Sorry Stan, I
>know you can't please everybody, but this is goofy!

I liked the old way better also, but then again, I didn't speak up during the "poll" so if that is how this SIG is going to be run, I guess we are all SOL.

-Jeff

P.S. I use both hotmail and pocomail and both treat reply and reply-all properly

> So why would you want the original sender to receive TWO copies?
>
> Just curious,

Sometimes the listserver is broken, sometimes users read lists from the web. Sending them a direct reply is often more expedicious and provides for better communications! Or, maybe we should change APRS so that it only works over the APRS IS system so that everyone would see everyones traffic all over the world?

I think that the point is that any good tracking program should use the official OBJECT NUMBER instead of a name like NO-44 or PCSAT. NORAD and NASA only uses the number and could care less what we call them on the "outside".

My tracking program still has the satellite listed as PCSAT so it wouldn't update the keps properly if using the name function only. Better to use the number.

>
> True, but if you have a list of keps from the

I counted your vote correctly, Bob. First, you voted in favor of the change,
then you withdrew that vote and voted against the change. (I accept your
apology.)

How your (or anybody else's) mailer interacts with the SIG settings is
mailer dependent. You say that when you hit the REPLY button, your mailer
asks "Use REPLY-TO ADDRESS" or SENDER?" When I hit the REPLY button, my
mailer does not ask anything and simply addresses the message to the list.

It is impossible to set up Lyris to be compatible with every mailer used by
its 1200 subscribers, but it is possible for the SIG subscribers to option
their mailer software to interact with the SIG in a way that is more to
their liking or find a new mailer that operates more to their liking.

Regards,

Stan, WA1LOU

This is the latest virus that's out and about.  It's detailed on MSN but
it contains it's OWN email engine.  Nasty little bugger....  The reply
to addresses are spoofed by the virus which is why you get unknown user
or postmaster errors.

PINE?  Yes, I still use it ... but not for this list.

Bob, I'm not sure *why* you need to "...go back & read the address list"
If there _is_ a "Reply To" field then isn't that where they should expect
reply's to go?  As I understand it, if there is _no_ "Reply To" field then
PINE does not ask the question.

But, I'm sure, PINE users are a minority of users here (and most everyplace
else, too)

With Outlook Express, now when I hit Reply it goes to the list. Reply All
shows two copies of the list address in the "To" field (and if the sender
CC'd someone that address will be in the CC field)  BUT I think the list
software filters out the dup message.

I'm happy with this.

O.K.; Whatever:
I was looking for NO-44.
(thanks Ron)
Yes Earl; very FEW tracking programs would
have this other designator, but then again,
we are talking about a PRO's computer; Macintosh
so you KNOW it's going to " think OUTSIDE the box ".
Sorry people this program is ONLY available in Mac OS.
....too bad, it's FANTASTIC.
It has more than TWO DOZEN different sats in it.
All you do it select the one you want, and BINGO..it
shows you where it is, with NO input required.
*I think, so it appears)
Now that I know it's #, I can go back and see if
it's working properly.

I'm not debating what everybody wants to/may call it:
But THIS particular program has it called: NO-44 apparently.
So THAT'S how I have to bring it up to view it.

I think that's a poor attitiude. First, we've already determined that not everybody reads your posts, Stan. ;) Second, I think many people saw the topic of discussion and never bothered to read ANY of the discussion, because it wasn't directly APRS related and had no idea that it would impact them. I only read the posts one day because I was bored...

Mob rule doesn't always work and that's why we live in a Representative Federal Democratic Republic. One man - one vote, only works when there is sufficient public notice so that people have no excuse when it comes time to be counted. And I don't think people here were given that notice, nor were they given the opportunity to figure out how this would impact them. Furthermore, we elect officials to MODERATE (hint, hint) public action, because what the masses want isn't always what's in their best interest.

The change is obtuse and counter-intuitive. It makes it harder to reply to a person on the SIG privately. So I guess the next time I make a crass and rash comment to someone that I would've kept off the SIG by hitting the reply button will now get sent to the SIG - SINCE THATS WHAT THE MAJORITY WANTS. I guess that comes under the old adage, "Be Careful what you wish for, you just might get it..."

That was part of the reason for the change ... "to make it harder to reply to a person on the SIG privately" ... it seems to be an unavoidable by-product of making it easier to reply to the SIG.

This comes up on various mailing lists occasionally (reply to sig, or sender) and it can be as controversial as a discussion abortion or gun control. The LIST OWNER or list manager has the right to do what he/she wants with his list. IF he wants to let the subscribers have a say in the choice, he can.

I run a list myself, and I want the default to go to the list, but I belong to another list that wants it just the opposite (and when I suggested it

```
change I got little support) You will *never* please everyone in this
regard.

What I mean is that before the 17th, if you hit REPLY it would go
to the original sender. If you hit REPLY-ALL it would go to the sender and
the list. Very inconvenient for people like me who try to keep most
questions and answers public and also try not to send 2 messages to the
original sender. Before the 17th, I found that I had to edit the To: line
manually on almost every post.

I think people should stop whining.... and

1. if you think you voted wrong... well... that's tough. Ask the people in
West Palm Beach last elections.
2. If you voted against change and now there is change... you've been
outvoted. That's called progress.
3. If you don't like how it works now, you should get a real email client,
or stop replying to people on the list. The noise-level is already so high
here, that people start reading threads selectively.

Your mileage may vary.

But the change DID NOT make it easier to reply to the SIG.  Hitting the
reply button now sends a response to the SIG, but it DOES NOT quote the
originator of a message by name (by defualt).  So the NET EFFECT is there
is NO CHANGE to how replies are made to the SIG, only to how replies are
made to the originator.   And because hitting "reply" does not (by default)
quote the originator of the message by name, it only makes reading a thread
much harder.

And to quote a person by name by hitting reply to all (by defualt) now
sends TWO identical responses to the SIG, resulting in mail bounced by
Lyris, unless you maunally edit the "to field."   I seem to recall someone
before trying to play the "wasted bandwidth" trump card in this discussion...

Yes I can change the default quotes and replies on my e-mail client, but I
subscribe to more than one SIG, and MOST email clients only allow you to
make this change globally.

And remember, MOST people on this SIG are NOT computer technicians, so they
have no idea how to change how their email client's attributes in this
regard.   And although Stan made the comment that people will need to
upgrade/change their email client then, THIS IS NOT AN OPTION for some
people.  Many ISP's are forcing people off POP3 accounts so people have to
take the email interface they're given.   This is why I'm leaving Qwest as
my ISP.   And how is forcing 1200 people to change or reconfigure their
email client conducive to making it EASIER to use this sig?

And again, this change is counter-intuitive, and goes against 15+ years of
convention in regards to how the majority of 'Net SIGs, Usegroups,
Newsgroups, and Round-Robins have been run.   Some of us remember the Big
Blue Wave...  ;)

Finally, from the tenor of the discussion, I think people were voting that
they DID NOT want private responses, only responses to the SIG.

Regards,

Mark

And that's anothere reason why this wasn't a vote, because people avoided
reading this thread.

As a wise person here noted (don't recall who though) - It's far easier to
delete in a GUI, than to add. Point-click-backspace or
point-click-highlight-del is far easier than going the other way...

I hardly see how this is inconvenient.

Because the Email address of the original sender "sticks-with" the message
instead of being lost forever. I can't count the number of times I have
gone to great length to answer someone's question and hit send, only to
see the reply come back on the SIG without the original questioner's email
address being attached. For any follow-on or further off-line reference
to that question or topic, the original sender's email address is lost
forever.

```
"Ramon F. Kolb" <ramon@ieee.org> stated:

>
>I think people should stop whining....

I've not seen any whining, just well founded arguements on both sides. I may
not agree with them all, but I think your charecterzation of whining is not
fair.

>1. if you think you voted wrong... well... that's tough. Ask the people in
```

>West Palm Beach last elections.
>2. If you voted against change and now there is change... you've been
>outvoted. That's called progress.

This was not a vote. It was yet another meaningless poll.

>3. If you don't like how it works now, you should get a real email client,

Clearly you are confused. With a RFC compliant mailer, things worked as they should before. That is, a "reply" went to the orginator of the message, "reply-all" went to the sender *and* the list, as it should. Now reply-all sends two copies to the list, and "reply" just the list.

Anyway you look at it, people will need to do more editing of the to/cc fields to do what they want. Unless of course you are one of the people that think every little piece of drivel should show up on the list. If a list is dead, I can be convinced of this arguement, but with a list as busy as this one, we should do whatever we can to make our posts well founded.

>or stop replying to people on the list. The noise-level is already so high
>here, that people start reading threads selectively.

Which makes me think you are saying the opposite of what you really mean. The change will REDUCE the S/N even more as the default is to put everything on the list, intended or not.

Like I said, the poll was pointless. The moderator wants it this way, and like it or not (I'm a not) that is the way it is. I can accept this. Just don't tell me about voting, it sure as heck wasn't a vote.

-Jeff

Hey, I would have sent it to him in private, but neither Reply not Reply All shows his email addy anymore.....in a real email client that is. Netscape.

If you send 3 copies for reply all, then you have CC to
the group as well.

It isn't broke, you just worked around the problem.

I am using OutLook Express version 6.00.2600.... on a Win98SE
system.

I just did a reply all, and got TWO copies to the list in the To: field.
I also
got ONE copy to Stan direct in the Cc: field. I got NONE to you Bob
in any field.

However, it did print the following in the message:

Yes there is a lot of those types of messages.

When you get a message like that, set your option to
show FULL HEADER and you will see the path of other
sites it passed through before you actually got it.
They do that to hide where the message originates.

Most of those types of emails use a non-existent FROM so
you will be more apt to open it.

>         Just curious,

Actually, in my case, replies that are direct to me go to a different
mailbox
than the list.  I get about 20 emails a day that are non-list.  They go to
my
general inbox, or to a few specific mailboxes automatically.  However,
anything that comes in with TAPR (or one of 3 other lists) in the header
goes to a mailbox called '"List In" that I can read 'low priority' as
opposed
to direct email that is high priority, or one of my specials (ok, I'll
admit,
I'm single...) and that takes EXTREMELY high priority!

Mike

```
Mine was just the opposite so I missed seeing answers to
questions that would have saved me LOTS OF TIME AND
EFFORT since they only went back to the sender.

There might be an increase for a while but I think you
will find a BIG decrease of seeing the SAME QUESTIONS
over, and over, and over, and over.........

The way it is now, everyone gets to see the answers the
first time.

Hi All --

Just to let you know that there are some other tweaks that we can do to Lyris, particularly with respect to what appears in the "Reply To:" field, that may make things work better. Stan and I are working on that, and Stan will post more details when we've figured out the most workable solution.

73,
John

Hitting reply to your message put one list address in the To: field.
Hitting
reply all to your message put TWO copies of the list address in the To:
field. This time it did NOT put anything into the Cc: field.

Again NOWHERE with either reply did I get any option for a private email to you.

Mike

That sounds kinda cool. Do you have any links to that? I want to do some
home automation to my house, and trying to decide how to do it.

-Jeff

Windoze' Machine?! ;
I run an iMac; DV thanks.

I HAVE found a problem/bug with the MultiMode program;
It basically doesn't work...all I get is a buncha' gibberish when
a packet comes on, occasionally a callsign, but that's all.
Maybe that is NORMAL, if I am copying an APRS signal.
I'll go over to HF; 300bps and see if the band is any more
open to try it on a standard text packet.
The PacSat program is FANTASTIC, and functions just
fine....I already caught the last PCSAT orbit by literally
SECONDS; thanks to it.
Unfortunately, it was so far north, I barely caught it for a minute
or so, but long enough to get into the UPlink.
```

I'm surprised at all the email and bickering over the list replies. I regret my part in it, and will contribute no more to the thread beyond this post.

I have had to manually edit almost every reply I've made to the list, up until yesterday afternoon. The list is now working in a more convenient way for me. However, if it's going to cause arguing and loss of list members, then by all means, change it back. I can continue typing addresses as I have for some years now.

> Come on Bob! This is a Bogus excuse for lack to properly replying. See
> header above

It is not bogus at all. Look at this header. Now all I did was hit REPLY under this new system and only one copy goes out. It replied to the SIG only, and nowhere in this message anywhere is your EMAIL address retained. In fact, no one knows who I am replying to other than some guy named spider. You may call it bogus, but to me it is the most insidious way to do anything if you cannot even see who it was that the email is directed to.

That might not be so important in many cases to the SIG, but in many cases, new information arises in the discussion, and then there is no way to know who was the origiinator without reverse sleuthing which none of us has time to do...

So you might call it bogus, but I call it fundamental to keep track of who started any given thread...

Stan ask the aprsig members;
>>When you reply to a message on this SIG, the SIG software is set up so that
you end up replying to the person that posted the message. Your reply will not be posted to the SIG unless you Reply-To-All or you add the SIG email address in the TO: field of your message.

Is this the way you like it? Many other SIGs including two others I administer are set up to reply to the SIG rather than to the person who posted the message. Would you prefer this option?

Let me know if you would prefer to reply to the SIG or reply to the person who posted the message. The majority rules!

73,

Stan, WA1LOU, SIG administrator<<

I really don't know how Stan could have been any clearer. Yes the results reflect a "Bill Gates majority" and that was predictable and to suggest Stan was deceptive, when he composed his survey is unfair. After editing to hopefully to insure, this will not come across as a flame towards Gregg and because that Bob and Earl had expressed an opinion that the survey was confusing, my letting this go to the list a deliberate action.--73

I would have thought that for the worm to be spreading so fast so early
this week, it would have at least had a few hints that had gotten to the
virus scan people earlier.

>   2. You can't type an address?

I use OE, and I never even SEE someone's address at first. I have to
reply to a message, then DELETE the To: field which points to the list.
Then cut and paste from the header in the message From: field to
get someone direct email.

More trouble than it's worth, unless you REALLY want to keep it
private.

Mike

Well, I never said it was deceptive at all, And your comment that you
cannot see how stan could have been any clearer makes sense only if what
'your' mail system does is what his does.  Now given that my email system
does not do what he says his 'currently does' then it certianly leaves
what he did say open to all kinds of conjecture and missinterpretation..
In that sense, all I said was that it was "confusing".

So please dont say I was accusing Stann of being deceptive.

He has a hard job.  I was only feeding back what appears to be confusing
on my end because I dont run Bill Gates software like the majority... and
so what I see is not what he implied I should see... so to me, that is
confusing... no deceptive....

But now, no one can see who I am replying to can they...
I sure cannot tell...

Bob

> header above

It is not bogus at all. Look at this header. Now all I did was hit
REPLY under this new system and only one copy goes out. It replied to the
SIG only, and nowhere in this message anywhere is your EMAIL address
retained. In fact, no one knows who I am replying to other than some guy
named spider. You may call it bogus, but to me it is the most insidious
way to do anything if you cannot even see who it was that the email is
directed to.

That might not be so important in many cases to the SIG, but in many
cases, new information arises in the discussion, and then there is no way
to know who was the origiinator without reverse sleuthing which none of us
has time to do...

So you might call it bogus, but I call it fundamental to keep track of who
started any given thread...

Ok, I was going ot stay out of this but, If I hit 'Reply' It goes to the
SIG and if Hit 'Reply All' it also goes to the sig. so I don't see how the
software for the sig is set up.

Don't fret too much about it, this list is like many I'm on, give 'em a yes or no question to reply to, and you'll get white papers, doctoral dissertations, and a couple novels on what it takes to decide yes or no.

Hay Josh:
Write me your email off SIG (the one you use personally)
I can't get you now!; due to this REconfiguring!
I wanna' ask you how you have the tnc talking to
the script program.
I'm running an iMac now, so being that it's a USB port,
not sure I can rig it up!

Please don't take this the wrong way, Earl, 'cause you're a nice guy and
all.   But wouldn't it be more convenient for you to: cut in line, pass
people on the right, ignore stop signs, elbow your way onto an elevator or
bus before exiting passengers got off, etc...

So making hundreds of people modify the settings of and/or change email
clients altogether so that you don't have to (point-click-highlight-del) is

better how?   And BTW, in my case I still have to do the same as I did
before, except now I have to point-click-highlight-del something much
longer than a standard email address. That being: "TAPR APRS Special
Interest Group" <aprssig@lists.tapr.org>

Thanks,

Mark

Have you tried the Mac ham software group (ham-mac@mailman.qth.net)? Chris
Smolinski, the author of Multimode, is an active member there.

I'd check your own settings and connections before I blamed this program.
So far no one has reported any problems with the packet mode.

Dear Carlos,
Welcome!  With the exception of anything dealing with e.Mail, please...ask a
newbie question so we can refocus on why we're here. :o)  You'll get a ton
of help from folks who are ready, willing and able to do so.  APRS is cool.
We'll help to get you active. :o)

Warm regards,
Ev Tupis, W2EV

```
At about 5 PM EDST, I tweaked the settings of the APRSSIG. Please email me
directly (stanzepa@earthlink.net) with your comments regarding these changes
so that we don't tie up the SIG.

Thanks in advance for your patience,

Stan, WA1LOU, APRSSIG administrator

560. [aprssig] maybe a new digi....

From: Ken Cechura <kcechura@umr.edu>
Date: Thu, 18 Apr 2002 18:01:50 -0500
To: aprssig@tapr.org
Message-ID: <LYR842-75064-2002.04.18-18.36.00--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Well, if i get the time to build the cable this weekend, W0EEE should show up as a digi (not a gate, just a digi for now) after saturday.... still working on the MOCOM, but just to get something up, I plan on wiring up a yaesu FT-2400 that we have here in the shack.... it'll be even better if I replace the memory backup battery in it... maybe a couple of AA's or something.

at any rate, it'll help to fill the hole between Jeff City, St. Louis, and springfield.

[ahh... an email with no mention of the reply debate....well, i guess not, i just mentioned it <g>]

```
I've already written to him, &
I SUSPECTED my settings being off/wrong.
He wrote back saying that half the time, he gets
the same thing.
I DID copy some traffic off of 10.151, & from 2m, but
it's not all that SOLID.

```
I'm sorry.. could you define "real e-mail client" for me please?  I use
Outlook (express and Outlook 2000) and Eudora.  Before when I hit reply,
the reply went to the sender.  When I hit reply to all, it went to the
sender and the list.  NOW when I hit reply, it goes to the list.  HOWEVER,
when I hit reply to all, TWO copies go to the list.
```

If you think the S/N ratio is high now, wait until two copies of messages
hit the list as (right or wrong) many people I know automatically reach for
the reply-to-all button for every e-mail.

I guess we're just all SOL..

Fortunately, "two" e-mails are _not_ sent to the sig on a
reply to all. Even though there is "two" To:s, it looks like
Stan had to set the listserver up to cancel the dupes!

Maybe Netscape, Outlook Express, and the main mailers were
doing it wrong all along, :-) and we will have to get use to
copy and paste. I wish it would have stayed fixed.

Sorry Stan,

It's still broke and I have no way to reply direct without creating an
address book entry or going through a convoluted cut and paste. Not worth
the bother.
There should not be any need to cut and paste or create an address book
entry for each individual in order to reply off SIG.  I use an address book
entry to reply to the sig alone and this should work for anyone with a
modern Email client.  If an Email client does not have an address book it
is worthless.

572. [aprssig] Help with Eudora after obtuse TAPR lists change

From: Mark Fellhauer <sparkfel@qwest.net>
Date: Thu, 18 Apr 2002 22:57:55 -0500
To: aprssig@tapr.org
Message-ID: <LYR842-75127-2002.04.18-23.32.31--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Although it's been a while since I poked around in Eudora's settings, I think you will find that if you want to properly quote someone by using the "Reply" option you will have to do more than go into the tools/options/replying menu. If memory serves me, you will have to fidget with the Eudora.ini file.

http://www.eudora.com/techsupport/ini.html

Although, I don't personally plan to change my .ini, this should point people in the right direction to do so if they desire.

IMHO, someone who is FOR this change should assemble a walk-through for the top 10 email clients so that people can fix what wasn't broken before. It's the least you guys can do. And/or people with questions on how to fix their email clients should round up a list of people who were/are PRO-CHANGE and email them directly on how to fix what wasn't broken before - and don't forget to Cc: Stan when you do so...

Finally, please keep track of how much time you spent (in minutes) personally to make this work. Remember the national US average for a in-home computer service call is about $60 per hour (1st hour not pro-rated). According to Stan there are 1200 people subscribed to this SIG. If 25% of you have to figure out how to work around the "SIG improvements" and it takes 15 minutes to do so, that's quite a bill we should be sending someone... even if it is a mock invoice. ;)

Regards,

Mark

Rendered body type: text/plain

I'm running Netscape 4.78. On all emails other than from the SIG, if I
hit REPLY ALL, it puts in the address that was in the FROM: and the
addresses that were in the TO:. When I REPLY ALL to SIG emails, it only
puts in the REPLY TO: address. Before the change, REPLY ALL put both
FROM: and TO: addresses. Anybody know why Netscape seems to behave
different to the SIG than to other email? Is it the REPLY TO:?
Anybody know of any Netscape tweaks?

I like the REPLY going to the SIG, but it would be nice if REPLY ALL
went to both originator and the sig. Not that I would want to send it
to both addresses, but it's easy to delete the SIG leaving just the
originator in the rare case that I reply direct to the originator.

>....the Tiny Trak and the Tiger Trak units?

Any Kantronics TNC with 8.2 or newer firmware can be used as a tracker.
John Hansen's KISS mode TNC works as a tracker.

Any TNC that supports KISS mode can be used with most APRS software. If you
have a sound card most if not all of the windows clients can support the
AGW packet engine. (basically that's a sound card based TNC)

PIC-E, MIM etc. work too.

I'm not sure that really answered your question. What are you looking for?

Bill

I came up with a theroy. If we have stand alone Encoders such as the
TinyTrakII, Why can't we have Stand alone decoder to attach to a radio
or scanner to decode the APRS packets without buying a TNC. If they are
out there, does any one know where I could get one?

Also When I check my position on findu, It shows where I was 5 days
ago, even though my D700 has sent new packets. I also have WinAPRS
running on my machine in TCP/IP mode and I can not see my car on the
map. Where should I start checking. I don't recall changing any thing
in the radio.

Is here again!

APRS presentations will soon be asked for. In fact I've got one of my
own to do.

Has anyone put together anything new? Any really effective and/or
success stories? Any horror stories to learn from?

Hand outs? Visuals, examples? Common questions? Areas missed?

What's worked? What hasen't?

Time to start a 'presentations project' at sourceforge?

DO this in software with the AGW packet engine which turns your sound card
into a TNC. Just feed your RX audio into the line input of the sound card.
More info at:
   http://www.qsl.net/soundcardpacket

Hi James,

Jan Crystals in Florida come to mind, but don't MFJ offer
crystals for their radio?

Sometimes you may need to supply info on the specs of the
crystal as well as the frequency you want. In some cases you
can send them the crystal you have, and they will know how
to cut the new crystal to the new frequency..  Good luck

Robbie

If it seems as though it's functioning different then it
WAS, maybe it got CORRUPTED.
I am also running 4.78, and my ADDRESS BOOK will NOT
function. If I click on someone's return link, you're
supposed to get a pop up that allows you to put them
directly into the address book...it WON'T WORK.
However many times I try, nothing ever shows up in the
address book, however I changed USERS, and checked out my
WIFE'S address book, and HERS' appears to be functioning
properly....this spells CORRUPTION to me.
Don't bet any money on it, but that's MY guess.
Time to upgrade to Netscape 6?; the newest one is 6.2.2
....supposed to be some GREAT, "New & Improved" version.
"So what were we using before?; OLD & lousey " ?
> I'm running Netscape 4.78.  On all emails other than from the SIG, if I

Rendered body type: text/plain

```
I run a 1270C.  From what I understand, you can basically
use ANYTHING, ANY tnc that functions properly should work
fine. What you CAN'T use it for (the 1276) is to make a
"stand alone" DIGIpeater out of it, WHY?; I couldn't tell
you.. It should work just fine to operate regular APRS.
(from what I have heard)
You MAY not be able to wire up a GPS to it, but if you're
running a home station; you don't NEED one. (I've NEVER
had, and still don't have, a GPS unit)
(Maybe I should STOP OPERATING until I BUY ONE!
Daaaaaaaah)
> Will a MFJ-1276 TNC work for APRS? A friend of mine has one and wants to
> set up a home station.

Does anyone on the list know where I can obtain a crystal for a MFJ Data
Radio at?

Any help would be appreciated.

Lotsa laughs on that one. Your asking fellows who want to break the SIG because they don't understand how mailers are supposed to work to write a technical document explaining it. This was tongue in cheek, right?

I think you'd have more luck asking for a paper justifying taking cuts in line at the airport. At least the premise is honest.

Hmm, the MAC version must be different. I'm using Outlook Express
6.00.2600 on Windows 98Se and there are only TWO options.

"Reply" and "Reply All"

Both of which ONLY reply to the 'list', NEVER to the 'sender'. In
fact, the ONLY way I can get a 'sender' address it to reply to the list,
then 'cut and paste' the address from the body where the sender shows
up and to the "To:" field, and then manually delete the list entry.

A lot of steps to do something that's just so much simpler to let the
list read. What with all the original discussion centering on how to
make
it EASIER to reply privately to keep personal replys off the list, the
current state of affairs seems to be a giant step backwards.

Well, it's been fixed till it broke. At least, from my point of view.

Rendered body type: text/plain

Using Outlook Express 5, when I Reply, it goes to the list. When I "Reply
All" it sends two copies to the list and none to the originator.

Prior to the swtich:

Reply went to the sender.
Reply All sent one to the sender and one to the list.

I thought the "change" was basically going to do nothing more than reverse the priorities so that Reply went to the List and Reply All would still go to the List plus the Originator.

That's obviously not what's happening and I think the swich "broke" something.

I'll try the same thing from home tonight and see if Outlook Express 6.x does the same thing.

(I have changed nothing in my mailer configuration...and don't intend to, because nearly all the other lists I participate in work just ducky in one form or another.

I've just checked the following lists and it shows most work "correctly".:

List	Reply Goes To	Reply All Goes To
Amsat	Individual	Ind + List
Mixw	List	List + Ind
TowerTalk	Individual	Ind + List
Trx-Manager	List	List + List (acts just like aprssig since it was "fixed")
Sarex	Individual	Ind + List
IRLP	Individual	Ind + List

This suggests to me that the aprssig et al are configured improperly, since the switch.

Hope this helps someone figure it out....but it ain't a mailer problem, it's the listserver configuration, or the other mailing lists would show the same problem and they don't, with the notable exception of TRX which I contend, is also misconfigured.

73,

...hasan, N0AN

mostly about peoples misbehaving email clients, and possible changes to the
sig?

and... to make it on topic:
I have an (old) PK232, can it act as a digi WITHOUT changing firmware? (I
have a KPC9612 sitting next to it, but the cable is already built for the
232) also, does anyone have maybe a "recommended settings" list for the
'9612 acting as a digi? something like this might be nice to put together,
for those of us who don't know a whole lot, but would like to put up a digi
where one is needed, so we can learn some <g>

again, if i can learn all this stuff, and get the cable built, there should
be a new digi popping up here in Rolla.

Thanks
Ken

KC0CZI- can you contact me off-list so i can maybe ask you some dumb
questions when i get this thing set up?

Rendered body type: text/plain

Amazing how much I learn (yet already know since I know how to use
email) from this sig on using email.. and I thought this was a APRS SIG.
KISS at its best. Maybe one day when I grow up I can explain to my kids
how to read and send email! All I would have to do is pull up this
archieve (if its still around)

And the subject has been asked to be changed several times! Yet we still
have morons and incompetent people that just have no clue as to what
email is/does.

Just my 2 cents while I am in the process of unsubscribing due to the
Illiterate and incompetent idiots of this list that have no clue on how
their email works and tries to pass what they learned from their 4 year
old kids off to us.

-----Original Message-----

To: TAPR APRS Special Interest Group
Subject: [aprssig] How to Reply in Microsoft Entourage/Outlook Express
Mac

There are three menu options for replying in the default configuration
of
the current versions Microsoft Entourage and Outlook Express for
Macintosh,
tested on both OS 9 and OS X.

Reply - Goes to sig
Reply to All - Goes to sig
Reply to Sender - Goes to the last author in thread

All three quote the last author in the thread

Dennis, N2LBT

The problem is I thought I voted for something really simple:

Reply > List
Reply ALL > List + Individual

Harmless enough....however, what I got was:

Reply > List
Reply ALL > List + List

and no direct way to reply to an individual. This is NOT what I voted for. We were better off the way it originally was. Per my other posts, the vast majority of other mailing lists I subscribe to work like they should. It's not a mailer problem, it is a list configuration problem.

It's a bit strange to remember how this all started....now I wish it had never come up. It also isn't the end of the world. 99% of the time, I want to reply to the list anyway, but now it's not particularly convenient to reply "privately" anymore.

And NO, I don't think "progress has been made"....that's ludicrous, but funny in an ironic sort of way.

I'm not sure I understand what you're saying here. Are you calling Dennis
Hudson a moron? If you are, then you haven't comprehended what the
discussion is about. Dennis provided pertinant information that's helpful
to the SIG. BTW, Thank you, Dennis...

So now we know of two email clients that work with the changes post 4/17
(that being one button reply to sig with named quotes and no
deletes). Those being the above mentioned Microsoft Entourage/Outlook
Express for Mac and KMail for Linux.

Regards,

Mark
KC7BXS

Now I'm just an appliance op when comes to
'puters, but when you tell OE to reply, it has
been my experience that it replies to from whom the
message came.

So, if the message came from the SIG, it will reply to the
SIG.

Now, those who are 'puter literate can probably tell you
why, but I just know that's what it does.  I do remember
bein' told a 'puter is just a stupid machine that does what
it's told, but mine does all sorts stuff on its own!

Where did you get the line to type in? Sure, I can do that to, (type it in manually) but how many people are comfortable with that? It's one thing to type text. It's quite another to type a line of characters for
an
email address that is not generally recognized words or 'patterns'. In short, it's considerable effort. "Cut and Paste" is the easiest, and
there
it still requires MULTIPLE steps.

Besides, even IF you put up with typing an address (I thought computers were to make this easier!) you still have to remember to manually DELETE the list if you want it to be ONLY private.

Mike

613. [aprssig] lightest aprs tracker

From: Michael Bass <mbass@amgen.com>
Date: Fri, 19 Apr 2002 09:10:56 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75234-2002.04.19-11.45.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Here's a question for the list:  What is the lightest aprs tracker
possible?
```

I've tried a couple of times to run APRS while bicycle mobile in
Southern California with limitted success. Most of the packets I get
back to my home station were ones that were direct (within about 2
miles of home). The system I'm using now is a Garmin GPS 3+,
TigerTrack TM-1, and a VX5R (5W). All of this equipment is located in
my jersey pockets -- the three pockets on the back of a cycling
jersey.

I realize it isn't a matter of simply finding the lightest equipment.
The other objective is to be heard. The terrain I ride through is a
challenge to both RF and rider: lots of canyons and mountains. I've
tried two different beacon paths, WIDE2-2 and RELAY,WIDE2-2 both with
equal success. (Remember in SoCal, the WIDEn-N nodes don't respond to
RELAY.) And having the HT in the jersey pocket probably means I'm
getting a good "body null" as DF-ers know.

Since I ride a road bike, installing a D700 and battery is out of the
question. If you have any thoughts, I'd love to hear them.

I would think that the most important item would be an external antenna of
some sorts. You are probably getting nailed by your "body null".

I have seen pictures of hams using an antenna on their hat. Could one be
fitted on your helmet in some way?

Hmmm.... Seems to me it's the idiots who always threaten to
unsubscribe whenever they get frustrated with the topic of
conversation.

Just my personal opinion and observation. Not that it would EVER
apply to you of course.

Mike

You didn't say what you are using for an antenna ... so I assume it is the
HT's rubber duck. You'll get the most "bang for the buck" with a better
antenna mounted on the bike if possible. I used to run bicycle mobile (not
APRS) and had a regular mobile antenna (Larsen 2/70 dual band whip) mounted
to my luggage rack. I know of others who have attached a J-Pole made of
pipe to their bikes.

For those who say you'll need a proper ground plane for a mobile antenna to
work, remember that some mobile antennas are 'ground independent' and
also, no matter how bad it is, it's got to be better than the rubber duck!

Rendered body type: text/plain

Hi Mike et al,

Been there done that! 2 ways to do it.

1) Install a TX only board, an OEM GPS and a Tiny Track into a slim metal box with antenna sockets, power etc underneath your bicycle rack. Install a 5/8ths antenna on a spring mount onto the back of the rack along with the GPS antenna. You need the spring mount in case you fall off. You don't want the antenna to stab you in the back. The spring will allow your body to deflect the whip.

2) Install an HT, GPS etc into the pockets on the back of your jersey. Get a MFJ "HatTenna" clip and mount it onto your helmet as well as some ZipLock ties to fasten the GPS antenna on there too. Transfer the HT's antenna onto the HatTenna. You could also attach a 1/4 wave piece of wire to the outside of the HatTenna to improve the efficiency.

Here's a message I recently sent to MFJ and their reply...

----- Original Message ----- From: Bill Vodall WA7NWP To: mfjcustserv@mfjenterprises.com Sent: Monday, March 11, 2002 2:56 PM Subject: Data Radio crystals

Hello,

I have two 145.01 data radios that I'd like to convert to 144.39 for APRS.

Do you sell the crystals?

Bill Vodall,
WA7NWP

Rendered body type: text/plain

I don't know if it would be any lighter, but a Kenwood D-7 would allow APRS and voice at the same time and do away with one piece of equipment..the TigerTracker. A small (2' x 2") metal (ferrus) bracket would allow the use of a "Hershey Kiss" dual band antenna.

At 10:51 AM 4/19/02, Ronald Reams wrote:

>So, if the message came from the SIG, it will reply to the
>SIG.

The problem being the SIG didn't generate the message - it only forwarded the message to you. The person who wrote the message originated it.

At 09:47 AM 4/19/02, Ronald Reams wrote:

>I don't know about all this cuttin' and pastin' stuff,
>but I use OE and I am able to type your address in
>the Cc: line.

Again this is fine, but the issue is that the change was made so that people could click on "Reply" and reply to the SIG alone. There are several problems that arise:

1) The default setting for most (if not all) mail clients is when you click on "Reply" it quotes the author like this:

"At 09:47 AM 4/19/02, you wrote:"

Obviously this will not do on a SIG with 1200 subscribers and hundreds of threads. You are not properly attributing a quote by name. What we want it to say is:

"At 09:47 AM 4/19/02, Ronald Reams wrote:"

But that only happens by default on most mail clients when you click on "Reply to All."

2) Typing-in or Cutting a pasting a personal email address is fine. BUT... Not all mail clients show header information so that you can easily locate that email address and not all people provide an email address in the text of their message or tagline. Most POP3 mail clients allow you to selectively toggle whether to disply header info or not. The problem being that the two biggest ISP's in the country force their customers to use non POP3 email, so you must use their client, which may or may not be customizable. My own ISP, Qwest/MSN, is forcing the people of 14 states to switch to a non-POP3 email client or Hotmail... So as of next week my ISP/email address is changing...

This being the case - the changes to the SIG 4/17 are actually a step backwards and not a convenience as touted.

73,

Mark
KC7BXS

PCsat GPS:
Today I commanded on PCsat's GPS and within 4 minutes it had a fix. THis is without having any new KEPS since January, so moving at 17,500 MPH it was still able to estimate where it was so that its GPS could get a lock.

All next week we will probably command the GPS on for about 8 minutes during high passes over Maryland to give the GPS a chance to charge up its memory backup battery. This will make sure the GPS is ready for June when we get 3 full weeks of full sun.

No apologies needed. Those Windows users who might feel deprived, go
to:-

http://www.satscape.co.uk

I've been around the satellite scene since the early days, and this is
one of the best I've seen.

I'm using it at the moment purely for the APRS birds, hence the posting
to this group.

Incidentally, PCSAT (NO-44) really is working well at the moment. At
present I am doing some tests through the bird from a TH-D7 in the car.
The antennas is a very unobtrusive 19" whip and it works great. Much
better than my base station with it's dual band 'white stick' antenna.

Thanks for that information Bob. I saw it in my car today and meant to
query you on it. At the time I saw it, it was indicating a possible
default position, i.e., latitude 0.0 and longitude 0.0.

We all know where that put it. Over the equator with no longitude, i.e.,
one of those stations off the West coast of Africa.   :-) :-)

Thanks to everybody who told me about Sti-Co. The only thing is that they
think awfully highly of their antennas! LOL All three distributors in my
area want right at $200 for them. If anybody has any experience with them,
let me know. I'd like to know a little more before I plunk down that many
clams for one.

They are commercial grade, public safety market is about 95% of their
market... Mostly undercover as their disguise replacements are visibly
identical. If you flick them you can tell the whips are hollow fiberglass
with metal element, but beyond that... perfect replica's...
They are proud indeed, and justified as long as you can tolerate
commercial market pricing...

If you mean stand-alone, it will only be capable of being a dumb digi - no
WIDEN-n subsitution, TRACE support, dupe suppression, etc since it has no
APRS-specific firmware in it.

If you intend to use it with a computer to provide the APRS digipeater smarts
(i.e. something like DigiNed), then it should work as well as any other TNC.

There's your problem! Having the radio against your body is a good 10-15 db
loss!

Build a very thin 19-inch whip out of something like piano wire and mount it
on the bikes frame. (The weight and drag will be insignificant.)   Or even
better, mount it on the top of your helmet. Feed it with RG-174 or similar
ultra thin and light coax. The increase in radiated signal strength will be
enormous!

I agree, there is nothing very special about them but due to their target
market they can ask for those
prices and get away with it. They work but I was never impressed when I was
in the 2-way industry.

635. [aprssig] REF: Disguised Antennas

From: wa4tkg@attbi.com
Date: Fri, 19 Apr 2002 21:44:20 +0000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75287-2002.04.19-17.18.26--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
That price is RIDICULOUS!
What will the mounting environment be?
What will you want/expect your antenna to do for you
(performance wise)?
Will this antenna only be used for APRS, or do you want it
to function for local repeaters as well?

I have a plain 'ole dual band Larsen; 5/8 wave in the
ATTIC of my apartment building, (of course it's 50'up, but
that's kinda' BESIDE the point) and it works FANTASTIC.
I run standard packet; to the tune of only 10W out, to a
BBS that is a good twenty miles away, and I still get into
it just fine.
The local DIGI is so HIGH, that it is useable with only 5W
out, but that doesn't count I suppose.
The point here is, you don't need to spend OUTLANDISH
amounts of money to get on the air.
If you are in a private home, in a single story house, my
bet would be to get a small 5 element yagi (possibly dual
bander, if necessary) and nail it into the rafters if you
have to.
If you have a TWO story house, I'm SURE a simple vertical
would work just fine, as long as you have good elevation
around you. (NOT in a VALLEY)
If this is your OWN house; personally I would get a mag
mount, and look for a good piece of sheet metal hanging on
the INSIDE of the attic, and KER'CLUNK!; stick it, and
```

forget it.
It'll NEVER rust/corrode, cuz it's INSIDE the house, and
you'll never have to worry about it blowing away unless
the ROOF BLOWS OFF. *or gets BLASTED off, which is the
case usually down here in Florida)

The orginal post in this thread clearly indicated the antenna was for a
stealth installation in a VEHICLE !

Sorry friends, but ...

... more than 50% from 108 entries have the same stupid OT since several
days: 'How to reply a message' !!!
Read the HowTo's (i.e. about full quoting a html-message) and think about
the topic of this mailing list! I recommend to discuss this problem on a
dedicated newsgroup.....

Rendered body type: text/plain

```
Is MapBlast having troubles today?  I connected to the web port on my
WinAPRS 2.5.1.  I get the list of stations heard.  When I select a station
I get the three map windows but they are all blank white except for an
"Error: improper settings" in the middle.  I click on one of these blank
boxes and the MapBlast site opens up.

I have been working on DANAPRServer to be able to use javAPRS to put my
APRS station on the Internet, but they don't touch the WinAPRS files or
folders...

Is anyone else having that problem or is it just me?

Thanks,

```
Allan,

I put my D700 under the back seat and mounted the control head
on the front dash using a Panavise mount I picked up at Gigaparts
www.gigaparts.com

The mount was extremely easy to mount without drilling any holes.
I just removed a piece of trim, removed  a bolt already in place,
put the Panavise mount in place, re-installed the bolt, installed a
self tapping screw, and replaced the trim on the dash. It was very
quick and painless. It also looks professional and the control
head is easy to reach and easy to view.

Anyhow, the guys at Gigaparts will know which mount you need
based on the year of your vehicle. I used the Kenwood mount
to mount the control head to the Panavise bracket. It looks
great and I was extremely pleased with the installation.

I made an extension cable for my microphone instead of using
the extension kit from Kenwood. I did not need the extension
cable for the control head and could not justify the kit to only
use one cable.

73's,

Tim - N8DEU
Huntsville, Alabama

Please excuse my ignorance but can somebody tell me if there is any Terminal type emulation available for the PIC-E ?? Will it run something like a TNC2 command set with a command prompt ?? Maybee the F84 is a bit short on memory for this but perhaps another PIC stuck inside a DB25 could do the emulation and talk to the PIC-E in KISS mode.. Now theres a wild idea..

I beleive theres a Kiss app for it and maybee a APRS digi app..

Where are some good places to find firmware/apps for it ??

Rendered body type: text/plain

All the firmware is located on the PIC-E FTP site at TAPR.ORG

There is no TNC type UI. I have seen the KISS mode firmware but have never
messed with it.

There is a group of us that has been talking about "updating" the Pic-E.
The two most important criteria will be for it to be much smaller. (Tiny
Track sized). The Pic-E is out of code space and we have been thinking
about LOTS of other software for it, including a UI digipeater mode.

Soon we will have our design criteria and wish list completed. There has
been NO talk of trying to do a TNC emulation mode. I really don't think
there is a reason to re-invent the wheel.

I have just purchased a KPC3+ for APRS. A few fellow hams published their
settings on the web and I used some of their ideas in configuring mine.
Anyone else what to share how they configured their KPC3+'s to make the
best use of the network, best functionality, etc.?

BTW, it works very well with a Garmin eTrex.

655. [aprssig] Disguised antennas{suggestion}

From: John Kraus <jfkraus3@cox.net>
Date: Sat, 20 Apr 2002 12:11:23 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75376-2002.04.20-11.45.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am not sure who started this thread but here is a possibility. On
page130 of the Fall/Winter2001 AES Catalog is a "Freedom Antenna". I think
it used to be called the Stealth Antenna. It is a patch antenna with
models for 2 Meters and 440 and is rated at 75 watts. I have no experience
with it but for a hidden setup it seems to be ideal. I suspect it performs
similar to or slightly below a ground plane but is likely to have
significant nulls depending location in the car. For an APRS setup it may
or may not work well depending on radiation characteristics. If it is
narrow beamed and subject to fading it likely would be a poor performer.
It is may be unlikely to perform well over longer ranges compared to an
whip type antenna but may work well in an urban environment. I have not
had time to find a link on the AES site but it should be there somewhere.

The catalog numbers are:

HVA-146
HVA-440

656. [aprssig] Why Disguise Your Antenna ?

From: wa4tkg@attbi.com
Date: Sat, 20 Apr 2002 16:39:34 +0000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

Message-ID: <LYR842-75391-2002.04.20-12.13.44--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If you REALLY want a disguised antenna, why not use your
regular CAR antenna?
(if it's of any good construction; that is)

MFJ makes a small tuner box, that allows you to use your
standard AM/FM car radio antenna on 2m.
Just a thought, it MAY even have a bit of GAIN on it.
(sorry about my RAMBLING response yesterday; missed your
original post, Daaaaah)

657. [aprssig] Re: D700 in Jeep Cherokee

From: "Tim Cunningham" <tim_cunningham@mindspring.com>
Date: Sat, 20 Apr 2002 12:31:04 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75407-2002.04.20-13.12.30--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There were several questions to my response, so I will attempt
to cover them here.

The Panavise web site can be found at http://www.panavise.com

The part number for the mount I used is 75122-296. It mounts to
the right of the climate control on my dash (1997 Jeep Grand
Cherokee Limited).

The mount is intended for an in-dash cellular telephone mount.
It was perfect for my installation since the D700 control head is
very light. The mount is very sturdy. Check the Indash models
by Panavise under the Cellular category on their web site.

If I get a chance to take some pictures this afternoon I will post
them on my web site this evening or tomorrow at www.qsl.net/n8deu

The 12 Vdc power was wired from the battery compartment,
around the back of the engine, and down through the frame and
out a hole on the frame near the back seat behind the driver seat.
I use the black/red high current zip cord that can be found at many
Hamfests. I drilled 2 holes under the back passenger seat near
the factory installed audio power amplifier and used 2 rubber
grommets from a local automotive shop to insure a tight seal for
the wires. When I realized that it was very difficult to find a place
in the firewall to route the power cord, I quickly took the matter in
my own hands and created my own custom routing. Like anybody
else, I hated the thought of drilling holes, but I figured the time it
would take to do it another way was time I could be doing other
things in life.

I also used a hole punch to mount an NMO mount antenna on my
roof top. The metal is thin so you need to find a sturdy point on the
roof. My 1990 Jeep had much thicker metal on the roof.

Tim - N8DEU

This is generally not a good idea. The problem is that a lot of car
antennas
are fed with high impedance coax that is a hair-thin wire in an open air
insulator and cannot take any kind of power. Even 5W might burn the
coax out. Take a CAREFUL look at your car antenna coax before you
consider this AT ALL!!

If you want the disguise, then pick up a CB antenna that's a disguise
antenna
from places like Antenna Specialist. For about $40 or so, you can get
an exact match (well, maybe not 'exact'. They only match one size of the
Chrysler base nut last time I checked...) You can throw away the CB
matching box, or gut it. And now you have a decent antenna (for the
purpose) with a decent cable feed, and even a decent box to build your
own custom match into.

Mike

This is a good idea, but remember to check those SWRs as many glass mounted antennas have VSWR problems with newer glass types that have metallic compounds imbedded in the glass as part of thier tinting.

Food for thought, always check the SWRs.

MAH

The run is underway, and everything seems to be working fine. As I
watched the first group take off I realized the table was confusing,
and I now am sorting it by leg and distance to go.

Everyone should take a look at this, it is an excellent example of
what APRS is capable of.

How can I go about generating maps for WinAPRS? I've looked around and
can't seem to find anything on this topic.

Thanks!

Hi; subject line says it all. Nearby retailers tell me they can't order the
software. I don't do credit cards anymore so online purchase is not an
option so, I need a source where I can order via the snail with money order
recommendations? Thanks and 73

A follow-up to a question I posted earlier in installing mobile
units in a late-model BMW with the "no 2-way radio" warning
sticker. Two hams e-mailed me off-SIG and said they had
installed and used VHF/UHF mobiles in their BMWs without any
problems. One ham even provided fairly detailed information
about his install, which was quite helpful.

669. [aprssig] Digi problems

From: Ken Cechura <kcechura@umr.edu>
Date: Sat, 20 Apr 2002 17:25:18 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75429-2002.04.20-17.58.22--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

ok, let me outline the situation, and see if anyone has any suggestions

1) TNC- KPC9612+
2) Radio- Yaesu FT2400
3) user- has no clue.

at any rate, i built the cables per the Yaesu manual, and KAN's online manual, I tried playing with all the settings, and eventually gave up, as i couldn't get it to work. What should ll the various parameters be to set up a digi?

notes: I got the TNC from Kantronics as a "factory second" (no warrantee); there was a blown trace on the underside of the board which was jumpered with wire. (hey, at $50 for a 9612+, i figured the price was pretty good!). The TNC will transmit on port 2 (the high speed port) and receives fine on port 1. for some reason, it will NOT transmit on port 1 (xmitok is on/on), and receiving is odd on port 2; even with a strong signal, it doesn't quite receive correctly..... it might be getting data, but the RX LED doesn't stay on during the signal, or it will only flip on during the slight squelch tale at the end of the transmission. I want to make this thing work!!! I COULD (but would prefer not to) wire up a harness to RX on port 2 and TX on port 1, if need be, but i really want to get this thing working on a single port as a digi....we desperately need one in this area!!!!!

ANY help would be appreciated.

thanks
Ken

677. [aprssig] Replacement for D-700A?

From: Dave Kaplan <dkaplan@steffeninc.com>
Date: Sat, 20 Apr 2002 19:55:39 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75449-2002.04.20-20.34.20--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I continue to replace items from my stolen Suburban.

In lieu if the Pharos I-GPS to feed the D700 I purchased a Tri-M Systems "Smart Skymaster". This is essentially a hard mount version of the Pharos. It is a combined antenna/receiver just like the Pharos, in a round package about 2 1/2 dia and about 5/8" high (looks like a standard round patch antenna but a little higher). It has a 3/4" stud sticking out the bottom that inserts through a single 3/4" hole in the roof like a Motorola-type antenna mount. A single nut threads onto the stud from below to lock it into position. The center of the stud has a 6-pin PS/2-type mini-din socket where you feed 5VDC in and take RS-232 NMEA 2.0 data out. Check it out at http://www.gpsoutfitters.com (Their US distributor) While it was a bit more than the Pharos it will have a better view since it will be mounted on the roof and not restricted to looking out just the front windshield. Not to mention the very friendly people at gpsoutfitters returned e-mail where Pharos did not.

Last week I asked the questions, is there a better radio for mobile APRS than the Kenwood D-700? With Dayton so close I would hate to buy something new just to find out it had been replaced or bettered by someone else.

Any ideas anyone?

Dave

Rendered body type: text/plain

Dave, no other radio does what the D700 does. I am begining to rethink my decission on the D700 verses a V7A with a seperate tnc. This is going to start a fire but my reasoning is this. As time has gone by, my D700 has gotten worse about the tnc NOT going from packet to APRS mode cleanly. It has gotten to the point that I have to perform a PM reset everytime. I have emailed Kenwood twice and not received a response. I plan to talk to them at Dayton.

The V7A can do the same split as the D700. You can tell the data port to work with either side of the rig, talk on VHF or UHF while the other side does APRS or packet. PTT behavior is the same for it as the D700. The downside, the overall package is higher in cost verses a D700 and is two pieces of gear instead of 1.

My suggestion is either a new D700 or a V7A with a KPC3+ (with my spliter cable :)). The sweet thing with the KPC3+ is that you can plug in the laptop/pda at will with out switching modes. I would suggest customizing the init and exit scripts to take care of the beacon parameters on the KPC3 so you do not have both the software and the tnc setting beacon. My next setup will most likly be a V7A and KPC3+ unless Kenwood comes up with a fix for the ill behavior of the tnc.

On my v7 the data side controls PTT! It will interrupt a voice transmission to send data.

Huh?? The Rigblaster is not a TNC!! It's only a couple of audio transformers(one for TX audio and one for RX) and a transmit PTT interface controlled by the handshaking lines (not the data lines) of a serial port. Unless you use a soundcard software TNC like the AGW Packet Engine or MixW with the Rigblaster, nothing is ever going to happen. No doubt, the Rigblaster is being keyed by one of the serial port handshake lines being set active by WinAPRS thinking it is activating a real TNC.

Rendered body type: text/plain

Anybody, especially in or around the Austin, TX area, seen or know what the series of MS150(X)-1 trackers are? The are at least 6 of them that I've seen, MS1502-1, MS1503-1, MS1505-1.MS1506-1, MS1507-1 and MS1508-1. MS1507-1 actually showed on my map as being out in the Gulf of Mexico at one point! There is no callsign associated with these trackers. They are displaying the default icon for SSID 1, the ambulance icon. Who are they and what are they doing? Inquiring minds want to know!

Rendered body type: text/plain

Well, a according to Findu, AI5TX-7 is near MS1503-1. A look at AI5TX-7's raw packet at findu says:

```
Raw packet: KC5JAR-14>R9UT0T,AI5TX-7*,WIDE:'|PGl"?R/]"4k}TURTLE SAG MS150
BIKE RIDE
```

Looks like they are having a Multiple Sclerosis 150 Mile bike Tour in the Texas Hill Country this weekend.

See: http://www.ms150.org/

I suppose all those MSxxxx icons are trackers in sag, first aid, supply & other support vehicles.

Just my guess here. I coordinated the communications for a MS bike tour about 10 years ago. This was before the widespread use of APRS.

Just my $0.02

de Ken,
N5EQT

Rendered body type: text/plain

```
Hey all,
   I have a problem maybe someone else has seen. For some reason my HT puts
me in Russia for APRS. PLEASE - yes -  I have checked my Lat/Long a dozen
times, yet I still show up in Russia.  Yes, I am on the correct position (I
am using pos 1 it has the asterisk next to it).
   Here is what I read on the screen
N 43  06.24
W 074  46.20
It reads FN23OC. So, it should put me in upstate NY (Which is where I live).
However, if I go to findu.com, I am in Russia.?????
   Does anyone have any ideas? Please respond directly to
cbouck01@twcny.rr.com
Thanks

You are correct. These are the support vehicles for the MS150 bike ride.
The estimated number of riders this year is in the 10K range!!!!!! YES
10,000 riders! Last year was the first time we did APRS support for the
emergency vehicles. With only marginal success for a multitude of reasons.
This year we have better digipeaters and better trackers. The trackers are
all custom packages that Motorola let us use that they use for a big
marathon in Austin every year. (They were originally designed to not have
hold off and only work in a time slotted environment with ONE digi. They
modified the hardware and software this year and they are working great.

There is a command post at each end listening to both the RF and Internet
data stream for redundancy.

Besides MS150*, you might see KC5JAR as the Turtle, or end of race vehcile.
Also Med4* is another.

Note that they DO ID, but the id is not digi'd. I checked :)

The trackers are a using a custom micro (Moto), Moto gps engine, mag mount
gps, mag mount VHF, and a Yaesu 1500 radio. All in a metal "can" (ammo
can). Standardized connections. Quite a nice setup.

Rendered body type: text/plain

After experimenting with various combinations of SIG software settings, it is evident that the SIG software cannot be set up to reply to the SIG without losing the convenience of replying to the original author of a message. Therefore, the SIG software is now set up to perform as follows:

REPLY sends your reply to the originator of the message

REPLY TO ALL sends your reply to the SIG and the originator of the message

Note that I provide no guarantees how these settings will interact with the settings of your email software. However, I believe that this combination of settings will work correctly with most email software.

I appreciate your patience during the past week as I experimented with the SIG software. There is no way to experiment off-line, so you all were guinea pigs during these experiments. I apologize for that.

I consider this matter closed and off-topic on the SIG. If you wish to discuss this matter with me further, please do so directly and spare the SIG.

Thanks for your cooperation,

Stan, WA1LOU, SIG administrator

Hi,

I tracked a friend from Chicago to Branson, MO and attempted to save the track from Winaprs. To some extent, I did. But lost the part coming back.

I used two different sites on the internet to get a dump of the 32 hour trip, only to find the data would Simulate the southbound trek 3 or 4 times! then after the last relay, the north bound portion would be displayed! I edited the data by cutting the duplication and it replays fine now BTW.

Was this due to a failure or crash at findu?

Robbie

You will also be seeing the North Texas/Southern Oklahoma version the first weekend in May. KC5ZDG is testing some of his trackers now. APRS is going to be use but the ride also runs through an area of Oklahoma that has limited coverage due to the terain. I have added a 4 element beam to the W5NGU-3 digi in addition to the db224 antenna that it on now (swapped out the 30 watt rig for a 50 to make up for the loss of tx on the omni). It has helped firm up the path to our north east but does not cover all the area of the ride by a long shot. There are 3 digis that are in the area that should do the job nicely.

694. [aprssig] XASTIR Bug ?

From: Neil Johnson <njohnsn@iowatelecom.net>
Date: Sun, 21 Apr 2002 11:33:05 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75592-2002.04.21-12.18.08--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I think I found an issue with XASTIR and compressed packets.

I'm in the process of writing test cases for APRS compressed position formats (it's for a Software Testing Class).

When I started generating test cases for symbols with overlays. I noticed that XASTIR doesn't display the DIGIT overlays.   It does seem to display Symbols with ALPHA overlays.

I checked my testcases against Ian's aprsdec.pl and it says that my packets are correct (except for complaing about the CALL SIGN).

Here are some of the packets for one symbol .

```
AT04V0*>APRS:=aPP!!TT!!A,@C                ~Symbol = AAzBox
AT04V1*>APRS:=bPP!!Tk!!A,@C                ~Symbol = AAzBox
AT04V2*>APRS:=cPP!!U'!!A,@C                ~Symbol = AAzBox
AT04V3*>APRS:=dPP!!U>!!A,@C                ~Symbol = AAzBox
AT04V4*>APRS:=ePP!!UU!!A,@C                ~Symbol = AAzBox
AT04V5*>APRS:=fPP!!Ul!!A,@C                ~Symbol = AAzBox
AT04V6*>APRS:=gPP!!V(!!A,@C                ~Symbol = AAzBox
AT04V7*>APRS:=hPP!!V?!!A,@C                ~Symbol = AAzBox
AT04V8*>APRS:=iPP!!VV!!A,@C                ~Symbol = AAzBox
AT04V9*>APRS:=jPP!!Vm!!A,@C                ~Symbol = AAzBox

Is it possible that a local IGate that sends data to findU is using WinAPRS 2.4.6? That version had a bug in it that didn't decode Mic-E packets correctly. It was fixed in 2.4.7.

This is not a Mic-E translation issue. This is the Unproto field received by findu.com:

TSPV24

This translates to a latitude of 43 06.24 N, a standard message of 111, and +0 longitudinal offset EAST. The key is the 4 at the end of the unproto field which, according to the translation table on page 44 of the APRS Spec is latitude digit of 4 and a W/E indicator of east. Either you have a problem with your D7A or the position you are transmitting (marked with an asterisk) has an east longitude entered.

Several MS walks are also going on this weekend around the country. I didn't have support for APRS at my event on Saturday in Michigan. No one else in the neighborhood has bought into the technology.

My understanding is that with the KPC3+, the Beacon Text (btext) is where one would enter what they want to show up as the "status". I have entered simply as "Duffy - www.wb8nut.com" and it never shows up in the status text of my home station or on the findu.com web site. Is my understanding wrong or am I doing something wrong?

Thanks,

Duffy

701. [aprssig] MS-150 on Florida's west coast

From: "Paul Knupke, Jr." <pekjr@tampabay.rr.com>
Date: Sun, 21 Apr 2002 15:39:22 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75606-2002.04.21-15.13.42--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
We just are wrapping up our version of the MS-150 (Wheels to Weeki
Wachee) here on Florida's west coast.  The ride was from NW Tampa to the
Weeki Wachee Springs Water Park (about 45 miles north of Tampa.)

We again used APRS to track most of our mobile stations.

There were about 350 riders.

The course this year was new from previous.   Part of the course was
about 25-30 miles of a recreation trail which no motorized vehicles
(except for the park ranger 4x4s) were allowed on the course.  We
divided up the recreation trail into several segments and had hams on
bikes patrol about 4-5 mile segments.

APRS coverage in some spots is poor so we installed a temporary digi
about halfway between the start and end.

It did help the converge though the coverage on the north end of the
course is not that great either.

We had trackers in most of our sag and rover vehicles and net control
had APRS.

We could certainly use more standalone tracker packages to install with
some of the other support vehicles.

The event went off without too many snags.  The course had to be altered
at last minute because vehicular traffic was too heavy and many people
were driving too fast around the riders and it became a major safety
issue!  The result was the course was shortened by 13 miles in each
direction.

It was nice to have a different route than the last number of years.  It
allowed a somewhat different group of hams to participate.

Now I guess it is back to the blackboard to adjust the route and suggest
improvements.

Hi Duffy,

A thought comes to mind that you need to set Beacon Every to
something like BE 10 for sending your beacon every ten
minutes..

Good Luck and 73

Should something send the callsign every X minutes to properly identify the
station as well. I know this was discussed some time ago but I can't
remember what the end result was. What about if a rule must be followed for
ten minutes like voice and cw communications need to follow?

Chris

Rendered body type: text/plain

The Dayton Hamvention is only four weeks away. It is the biggest congregation of hams in the U.S., if not the world, and the biggest congregation of APRS users, too. As a result, there is a lot going on APRS-wise at Dayton.

So you won¹t miss a thing, there is now a new Web page (http://www.tapr.org/~wa1lou/2002/2002.html) that is intended to document APRS-related activities planned for the 2002 installment of the Hamvention.

That page lists the following APRS-related information:

>>> Forums that are APRS-related.

>>> APRS-related companies, organizations, and individuals who will be camped out at some location in the Hara Arena or in the flea market.

>>> Other APRS-related activities.

>>> A list of your APRS compatriots who are planning to go to the Hamvention.

Please email me (wa1lou@arrl.net) any additional information you may have regarding Dayton APRS activity. Here are some things I¹d like to add:

>>> Where the APRS authors will be camped out. Is WB4APR going to be at the AMSAT booth as in the past? Where will the Sproul Bros. be this year? How about the rest of you APRS authors?

>>> Is there going to be an APRS Pizza Party this year?

>>> If you are planning to go to Dayton, let me know and I will add you to the ³Who¹s going to Dayton² list.

>>> Also, regarding the information on how to APRS in Dayton. Is the information on the Web site current? If not, can somebody send me an update?

Have Fun,

Stan Horzepa, WA1LOU

No, because your call-sign should be embeded in every packet (by setting MYCALL).

>From http://dididahdahdidit.com/kpc3v8.php

```
When to transmit:
BLT 1 EVERY 00:10:00
(Transmit every 10 minutes starting now)
BLT 2 EVERY 00:29:00
(Transmit every 29 minutes starting now)
BLT 3 EVERY 01:00:00 STARTING AT 00:01:00
(Transmit every hour, starting in 1 minute, so it doesn't confict with above)
BLT 4 EVERY 01:00:00 STARTING AT 00:31:00
```

(Transmit every hour, starting in 31 minutes, so it doesn't conflict with
above)

What to transmit:

```
LT 1 !4220.47NT08826.42W#PHG6460 McHenry County EOC WIDE/R RELAY/R TRACE/R
LT 2 !4220.47NT08826.42W#PHG6460 McHenry County EOC WIDE/R RELAY/R TRACE/R
LT 3 !4220.47NT08826.42W#PHG6460 McHenry County EOC WIDE/R RELAY/R TRACE/R
LT 4 !4220.47NT08826.42W#PHG6460 McHenry County EOC WIDE/R RELAY/R TRACE/R
```

Put your lat, lon, Symbol, Radio Range, and comment in.

What path to send it:

```
LTP 1 APRS VIA WIDE
LTP 2 APRS VIA WIDE,WIDE
LTP 3 APRS VIA TRACE3-3
LTP 4 APRS VIA WIDE3-3
```

(Begin religious discussion here :)).

Unless you've set your MYCALL parameter to something goofy, your call is in
every packet you send. You don't have to put it in the body of the packet.

Should change syntax to START in the BLT 3 & 4 Positions for version 8.3.
Doesn't accept STARTING AT.

> LTP 3 APRS VIA TRACE3-3

> LTP 4 APRS VIA WIDE3-3
> (Begin religious discussion here :)).

Beginning. :)
Here's a "friendlier" version of the above. These settings are only for use with a _high_ WIDEn-N digi (after discussion about the need for one with other local APRS operators).

When to transmit:

```
BLT 1 EVERY 00:10:00
(Transmit every 10 minutes starting now)
BLT 2 EVERY 00:39:55
(Transmit every 39 minutes and 55 seconds starting now, APRSdos fades out a
station after 40 minutes)
BLT 3 EVERY 03:00:00 START 00:01:00
(Transmit every 3 hours, starting in 1 minute, so it doesn't confict with
above)
BLT 4 EVERY 03:00:00 START 01:31:00
(Transmit every 3 hours, starting in 1 hour and 31 minutes, so it doesn't
conflict with
above)
```

What to transmit:

```
LT 1 !4220.47NN08826.42W#PHG6460 McHenry Peak WIDEn-N
LT 2 !4220.47NN08826.42W#PHG6460 McHenry Peak WIDEn-N
LT 3 !4220.47NN08826.42W#PHG6460 McHenry Peak WIDEn-N
LT 4 !4220.47NN08826.42W#PHG6460 McHenry Peak WIDEn-N
```

Put your lat, lon, Symbol, Radio Range, and comment in (keep it short).
Note the "N" between Lat and Long only for a WIDEn-N digi.

What path to send it:

```
LTP 1 APRS
LTP 2 APRS VIA WIDE
LTP 3 APRS VIA TRACE2-2
LTP 4 APRS VIA WIDE2-2

Beacon  Every 59
BText   >High level WIDEn-N digi email: w6xxx@arrl.net
CWID    Every 0
HID     OFF
MYAlias NONE
UIDigi  ON RELAY,WIDE,TRACE
UIDWait OFF
UIFlood WIDE,34,NOID
UITrace TRACE,34
Unproto APRS
```

A regular station (not a high WIDEn-N digi) should use:

```
UIDigi ON RELAY  (if you're the only station in the "neighborhood",
otherwise use UIDigi OFF)
UIDWait OFF
UIFlood %
UITrace %
```

Remember what you set for MYRemote and RText!! Or else!! hi hi

73, Cap KE6AFE

P.S. You can make a text file to feed into the digi, even remotely. Here's one for the fictional W6XXX WIDEn-N digi that you can edit for your own high WIDEn-N digi.

W6XXX-3.txt

```

A few weeks ago there was a discussion on this list regarding using the
OnStar GPS engine for APRS purposes.

I did not read the outcome of the messages...somehow I missed it.

Is there a way to get NMEA RMC and GGA data from an OnStar GPS engine?

Any information would be greatly appreciated.

73 de K6TVI - Rick

Rendered body type: text/plain

Hello Group,

I am new to the list and this is my first post. Sorry if this has been asked and answered before. If so, please direct me where to find it.

I am an experienced packet user. I want to put APRS in my panel van. I already have a TM-742 installed with 144-220-440 and don't want to touch it for APRS, I need the voice capabilities. I have three antenna's on the roof evenly spaced, one for each band. 144 up front, 220 in the middle, 440 rear. I will replace the rear antenna with a dual band and a diplexer.

My goal is to use the setup as a APRS station and be able to switch it to normal packet when needed for an activation of RACES/ARES/ARPSC. Using the laptop with the GPS and a map CD on long trips also needed. I want to use the APRS with and without the laptop on.

I have a Garmin 50 all the cables and an external amplified antenna.

I have a Alinco DR-1200 to use for APRS.

I have a laptop to use, PI-120 with CD and Floppy, 1 serial port, 800x600. Newer one coming.

I have a KPC-2 but I want to upgrade. Then the KPC-2 will be used later for a APRS-Digi.

* So I am asking which TNC and why? KPC3+ or PicoPacket with dual serial port?

* Also which program(s) for the laptop?

I am located in Southeast Michigan, 15 miles west of Detroit

Thanks, Shanon KA8SPW

KPC3+ W/V8.3 firmware - easy answer. The virtual serial port on the radio port to avoid any 'HSP' gotchyas is a god send.

Allows you the choice to use or not use your laptop and still function as a tracker. When the laptop is up, all functions and ops are as 'normal' - just exit your software (runs the 'restore.tnc' script or equal), unplug the serial cable and voila - KPC runs as a tracker just fine.

One idea, to quickly enable 'SmartBeaconing' is to use a TinyTrak-II for your tracker and then the TNC of your choice for your laptop. Setup a dedicated tracking radio, like an old HT.

Laptop? What OS? The iron you mention there would handle WinAPRS with some tweekage.

Windows - APRS+
Linux - xastir

Good luck!

73

Rendered body type: text/plain

Hi all,

Well Stan mentioned, if they're was going to be a APRS Pizza Party. I'll
let the voting begin, I haven't had much time to schedule it yet but if
the vote is high I'll go ahead and get the ball rolling. I have, caught
a fair amount of heat from some that don't like the Marion's Pizza
location. I have a comment, but I'll keep it to myself unless you want
to hear it. So please vote directly to me if want to have get together
at Dayton 2002.

Yes, the little ">" in front of the text did the trick.

Thanks,

Duffy

I just set up a Kantronics KPC3+ this weekend. The dual serial ports with HPC cable makes it easy to connect a laptop. I do not have a laptop connected however.

The nice thing about the KPC3+ is that you can remotely connect to the KPC from your home station to reconfigure the TNC's parameters. All the other trackers require that you to disconnect the TNC or interface to reprogram.

I would also suggest UIView32 for software on a Windows computer and not WinAPRS. UIView is actively supported and updated and is only about $15. WinAPRS has not been touched in a number of years and has a much higher registration fee.

         If you consider "less than a year" to be the same as "a number of
years" then you're correct.  The latest WinAPRS.exe is dated May 16, 2001.

Rendered body type: text/plain

```
Allan,
     yep. I have a D700 in my Jeep Cherokee. I mounted the face plate on the
dash just a bit right of the steering wheel. The Garmin GPS III is dash
mounted (using velcro) to the right of the face plate. The main TX/RX unit
is mounted to the left of the passenger seat and hangs from the lower part
of the dash. Passengers have no had any complaints. The antenna is a Larsen
dual bander magnet mount. I ran the coax under the seats through to the back
hatch where they exit through the weather stripping on the top of the hatch
door between the hinges.
     It works quite well and I still had room to install an ICOM 706 MKII
for HF operations!

Anyone here done the above... how/where did they mount... and what kinds of
power and antenna arrangements did they do...  I'd also like to hear of any
working GPS arrangement that uses a GARMIN GPS to display reported
positions...

TNX in advance

The major drawback of UIview is lack of support for vector maps like Win/MacAPRS's .map format or the very efficient PocketAPRS format and lack of zooming (related). If Roger could fix that then I think a lot more people will switch.

I myself am using Xastir which has everthing you can dream off and doesn't cost a penny (but requires a Unix flavour machine currently (including Mac OSx/Darwin)).

Kind regards,

Henk.

Rendered body type: text/plain

Thank you everyone who responded to my question about a D700 for a Jeep
Cherokee Sport....

An unrelated question (but still on topic)...

I have a "group" of hams who want to get on APRS... but they are "balking"
at the per user cost... for a licensed copy. The kicker is they don't want
to use DOS - nor Linux (despite the multitude of advantages of Linux)...

SO... I'd appreciate feedback from the group on an APRS software "package"
that runs on Win95 (my fingers are curling)... and is low cost... in
particular there is a desire for a "group license"...

The Hams are in eastern NC (a big APRS hole if you plot all the APRS
"traffic")... and this would go a long way towards filling this "hole"...

They are not likely to be day to day users... but rather their focus is
during "unusual occurrances"... in particular this will be software that
operates in County and District Emergency Management "Command Centers"
during drills, tests, and emergencies. Despite not being day to day
users... they have played with it enough to know that they do not want to
re-enter the parameters for the no-$$$ way of using the software... and have
"hinted" that if the cost was lower... they'd buy in....

I'll tell you how bad it is... we're working on donated PC's - with donated
TNC's - homebrew antenas - and borrowed rigs....

Thanks for the assistance...

UI-View32 works pretty well, but will not "zoom" maps, although it
does give you features that aren't available in other APRS
software. Registration is 10 pounds (UK).

Check it out at http://www.UI-View.com

Rendered body type: text/plain

Allan and the list

I've got a 2001 Cherokee. The D700 Control head is mounted above the rear view mirror. No problems with direct sunlight washing out the display, easy access from driver and passenger side, and not very visible from outside the vehicle. It's on the standard Kenwood quick release mount, so easy to pull out.

Cable runs above the sunshades and down along the drivers side dash, under the moulding to where the radio body is mounted under the back seat.

Power cables from the battery, through a grommet near the steering column, under the moulding to the radio.

GPS is a GPSII+ mounted on the dash using the Garmin mount. Good sattellite view, and easy to remove. Data and power run down the dash and along the center console back under the rear seat. I have power on a T-splice from the power feed to the radio. In the summer, I put up a sunshade which protects the GPS from prying eyes as well as sunlight.

Mic cord runs up along the center console. I've got remote speakers mounted at each side of the front dash to provide audio seperation.

I have a serial cable permanently attached to the radio routed along the center console as well, so I don't have to dig under the seat to hook up a laptop to run APRS software or the Kenwood radio software.

I put an old floor mat that more or less matches the interior color over the wires.

Antena mount is a Comet "SUV/Van" adjustable mount with a PL-259 connector mounted on rear hatch. Very adjustable to get the antenna at a verticle angle. It's down far enough so that my Comet Z-750 antenna barely clears the garage door. For cross country or "boonie" events, I replace it with my Comet SBB-7.

Now to get around to building the keyboard interface!

Hope this helps

Rendered body type: text/plain

First... thanks to the many responses in just a few minutes concerning possible directions on the lower cost APRS software... I'll pass on the potential opportunites to those running this show..

As an aside... and again... please don't get your panties in a wad.... an interesting conversation that transpired a couple of weeks ago that some of you here might get a "chuckle" over - some big wigs in the Emergency Management arena were asking questions (be warned... if your State EM folks aren't being kept informed... they may think the same)...

Extract:

Get this... one of his last process improvement efforts before he went to

[DELETED} was to entertain the thought of having the FCC shut down all Hams
(like WWI and WWII) during national emergencies... because of how terrorists
could use ham radios to communicate between terrorists
!!!!!!!!!!!!!!!!!!!!!!!!!!

My response...
#1 FCC is not in a position to monitor the use of vast parts of spectrum
that terrorists might use
#2 Hams are in a much better position (based on numbers and self appointed
freq cops we have (snicker)) to both monitor the freqs and DF on "intruders"
#3 It doesn't address CB, cellphone, business band etc use (which are still
too much for FCC to monitor)
#4 It would eliminate a very useful group of support personnel that EM and
local Public Safety officials could call upon...

Jeez... the stupidity and insanity never ends....

And remember this..... commenting here on the SIG does nothing about the
above thoughts... it's actively working as RACES and ARES staff - that
proves that we can help...

Now... why do we have both RACES and ARES.... I haven't a clue...

Rendered body type: text/plain

Hi Allen,

>>Now... why do we have both RACES and ARES.... I haven't a clue...

We have RACES and ARES just for the reason you indicated in your email:-)
If the President invokes the communications portion of the "War Powers Act"
and
has Amateur Radio Communications suspended, ARES can not longer function.
However, stations that are RACES registered can. The RACES program is a FEMA
program for communications assistance even in time of war.

The point many Amateur operators forget is we SHARE most of our frequencies
with the
US Government. While Amateur Operations are curtailed, certain frequencies
are authorized
for FEMA/RACES use in the Amateur Radio Bands. Rules for RACES exist under
FCC Regulations,
FEMA Regulations, and NITA Regulations.

This is one of the reasons we push dual registrations.

ARES allows us to practice and assist when communications are free and open.
RACES allows us to continue to assist when communications are restricted.

FEMA has an interest in the information that can be provided during an
emergency.
They would be open to allowing limited APRS use during a communications shut
down,
based on the situation.

Rendered body type: text/plain

Ray asked:

>Any AGW guru's know if it's possible to decode EMWin 9600 baud with AGWPE and
>a sound card? Is there an EMWin list somewhere?

I've never heard of anyone doing it.

I'm not sure what the modulation scheme is for EMWin. If it's not AX.25
packet and typical packet tones, then AGWPE doesn't know how to handle it.
If it is, then you'd need an application to tie into AGWPE to interpret the
data, and I've never heard of such an application.

Sorry.

Can someone in Philly, PA, please private email me about aprs activity there?
Will I have good coverage with my HT and 5w or do I need a more robust tracker?
Will probably be staying in horsham area. Hoping to set up a station in the
hotel room w/o having to bounce packets off the kenwood in the car. Also,
anyone know of any hotels which have internet access on site? Eyeballs would
be nice too since I'm going to be there for a while.

Thanks!
Wes

I have decided to open up port 23 for the worldwide feed on ahubca.net to
serve users who are at work or otherwise behind a firewall and cannot
connect to port 2023.  I will test this for one week to see how it works.
If you are behind a firewall for some reason, you may now connect to
ahubca.net port 23 for the worldwide feed.  Let me know if you encounter
any problems.  Thank you and enjoy!

According to which data stream you at talking about- Satellite, 9600
baud terrestial, 1200 terrestrial- The 1200 baud output we use in
Southwest Florida has the same shift as 1200 baud packet/aprs. It uses a
1106 byte "packet" with no bit shifting/stuffing etc.  At some very
basic level AGWPE has to be converting the tones to characters, before
it is built into a ax.25 packet.  If anyone has found a soundcard driver
for EMWIN 1200 baud please let me know.

Subject: [aprssig] AM I DIGIPEATING?

well, i have loaded a bunch of settings into the kpc9612 as a digi...
is
it working? if not, i get to take it apart and trace the port1
traces... like i said, i got a deal on it :) might just be an
incomplete trace, it THINKS it's transmitting on occasion... oh, the
call it is set up for is w0eee-7.

thanks
Ken

Rendered body type: text/plain

www.aop.org

VFR, IFR ops may be affected by GPS jamming in Alaska

Apr. 17 � AOPA has learned that the Air Force will be conducting training exercises next week that may result in unreliable GPS signal coverage. The exercises will take place from 11 a.m. to 1:30 p.m. local time, April 23 through 26. Despite earlier reports that the GPS interference would encompass up to a 310-nm area, spot jamming will affect a much smaller area, centered around the Big Delta vortac. Although notification of the upcoming GPS interference has not been officially released to Alaskan pilots, Air Force officials have told AOPA that they are working to provide better coordination and dissemination of future GPS interferences in Alaska. Typically, pilots are provided several weeks' advance notice of GPS jamming. Pilots who encounter GPS signal outage are encouraged to report it to ATC or Flight Service and monitor the guard frequency on 121.5. Stay tuned to notams and the Special Use Airspace Information Service (SUAIS) for additional details prior to flight.

I agree that mapping with UIView is not as good as WinAPRS.  But then
again, you can no longer purchase the mapping software that works with
WinAPRS...at least I believe that is still the case.

If I recall, there has been at least three or four updates to UIView in the
past year including Roger developing a telemetry decoder for PC-SAT which
was a plug-in module to the existing program.

I would also love a dynamic interface to a mapping program with UI-View.
But then again, for $15 bucks, he not getting rich on developing the
program.

To be a status, it should begin with the caharacter ">".  APRSdos assums
anything that is not otherwise parsable is a status, but not all software
does that...

I'd like to see a Bulletin Board (probably on the edge of the APRS booth) where we can put SPACE numbers of any good deals on APRS related things.

Remember, that the location of the APRS booth has CHANGED this year. We will have 3 booths all to ourselves.. Mike Musick made the arrangemnets and so he will be making a post eventually as to where to find us.

But if you see something neat about APRS, jot down the space location so others can find it...

Compared to the alternatives (total overwhelming of Dayton eateries that weekend and impossible to find a meeting place), Marion's seems OK to me. Yes, I heard one person say he didnt like the Pizza, but it seems like most people like it... and the pizza there is refreshingly different.

In favor
1) Its a known location, a tradition, easy to find
2) Its pay-as-you-go so no one has to buy Pizza just to attend the meeting.
3) Any change is a lot of (usually thankless) work for someone
4) Any change will cause 10% of us to never find the new place...
5) Any change will probably result in just as many complaints if not more

Just my 2 cents.

Rendered body type: text/plain

OK, it's a bit off topic, but then, maybe not

About 4 years ago I converted a lot of things to the 2.5mm headset that is the 'standard' for phones. Like my Gold Wing. I now have a 2.5mm jack for my 2M radio on the bike.

I sent off a letter to some contacts at RS about it, and they were interested. I made mention that they should offer a LOT of things that use this 'standard' for a headset/mic combo. I wasn't sure they really listened but I guess they did.

Then around Christmas of this year, I found a small box at RS that plugs into your PC sound card and lets you use the 2.5mm headset/mic with your PC sound system.

Then just today I spot ANOTHER item at RS. A PTT interface for the HTX-202 (and ICOM and others...) that plugs in to the HTs with the two jacks. And you plug in the 2.5mm headset/mic. For $15.

Now this last one is really neat, especially if you're doing public service
with your HT. (Oh, RS is 'closing out the 'bike helmet' hands free VOX mic kit for $3 right now. I bought 3 of them. And while I know they fit the 'Ranger' FRS radios and others, I don't know yet if they will fit and operate on the HTX-202 type interface yet. Gotta try...)

I KNEW the 2.5mm headset/mic could be a neat 'standard'...

Mike

Hello Tate,

Would I be able to use this setup under APRS while tooling around with the laptop and send/receive the short messages like I see others sending? Compaq LTE 5000 series laptop is running windows 98 with 16 meg of memory, looking for more now. Also wouldn't be against buying another laptop. Best Buy has a nice HP in this weeks flyer for $999.

This is the first I have heard of a virtual serial port. Can you tell me more?

In the mean time I will download the APRS+ software and look to see if I can download the manual on the KPC3+.

Thanks for the reply Tate, Please reply to list, others have also shown interest.

73, Shanon

Subject: [aprssig] Re: Need suggestion on which TNC?

KPC3+ W/V8.3 firmware - easy answer. The virtual serial port on the radio port to avoid any 'HSP' gotchyas is a god send.

Allows you the choice to use or not use your laptop and still function as a tracker. When the laptop is up, all functions and ops are as 'normal' - just exit your software (runs the 'restore.tnc' script or equal), unplug the serial cable and voila - KPC runs as a tracker just fine.

One idea, to quickly enable 'SmartBeaconing' is to use a TinyTrak-II for your tracker and then the TNC of your choice for your laptop. Setup a dedicated tracking radio, like an old HT.

Laptop? What OS? The iron you mention there would handle WinAPRS with some tweekage.

Windows - APRS+
Linux - xastir

Good luck!

73

         UI-View IS a good program for APRS, as it includes messaging as
well as plotting on a map.  The program comes with a few maps, but the nice
thing about it is that it also comes with a utility to create your own maps
from Street Atlas.  It won't "zoom" the maps, but you can create a map to
cover almost any area you would want.  take a look at the "freebie" and try
it a bit and you can register it if you like it.  See it at
http://www.packetradio.org.uk

W0EEE should be digipeating.... KC0CZI- let me know if i need change any settings if im causing problems with your area.

If anyone has a KPC9612 PLUS, i need a favor, i need either a) a schematic, but i would rather have some digital photos of the top and bottom of the board near the port 1 XMIT LED.... this is where the trace was blown off by kantronics, and replaced with a wire, im willing to bet that the resistor and diode that are floating in that area need to be connected....maybe not, but im trying to troubleshoot the hardware here....

thanks
Ken

In a message dated 4/22/2002 3:39:31 PM Pacific Daylight Time, ka8spw@comcast.net writes:

> Would I be able to use this setup under APRS while tooling around with the
> laptop and send/receive the short messages like I see others sending?
> Compaq LTE 5000 series laptop is running windows 98 with 16 meg of memory,

If you mean using a Windows-based APRS program along with a mapping program of some sort you need an absolute minimum of 64MB!

Win98 alone, before you even load a program, needs 15-20MB meaning that you are already exceeding your available RAM and are forcing Windows to use hard disk space as virtual memory. This works but since access to the HDD is measured in milliseconds compared to nanoseconds for the "real" RAM (i.e. millions of times slower), the system slows way way down.

The traditional guidelines are that Win95 barely runs in 16MB and flies in 32; for Win98 double that to 32 minimum, preferably 64.

> This is the first I have heard of a virtual serial port. Can you tell me
> more?

Many new machines now HAVE NO SERIAL PORTS at all; only the all-purpose USB connector. To connect "classic" serial devices such as a ham TNC, you have to use a USB-to-serial converter cable (widely available for $25-$50). The software driver for these devices create a "virtual" serial port with a COMn

```
identity that you can then tell serial-port-using programs to use.

The other usage of the term "virtual serial port" refers to the second serial
port implemented on the KPC3+ TNC for connecting a GPS device while a
computer occupies the main TNC serial port.  This second port which is
actually a single bit input of the KPC3 cpu (not a hardware UART) is created
purely in firmware by the KPC3+ ROM,  and is strictly a 4800 baud 8-N-1 input
for a GPS.  Without this second port, you have to improvise a hardware
"kludge" to connect a GPS and a computer to the TNC at the same time.

I have decided to open up port 23 for the worldwide feed on ahubca.net to
serve users who are at work or otherwise behind a firewall and cannot
connect to port 2023. I will test this for one week to see how it works.
If you are behind a firewall for some reason, you may now connect to
ahubca.net port 23 for the worldwide feed. Let me know if you encounter
any problems. Thank you and enjoy!

In a message dated 4/22/2002 4:58:02 PM Pacific Daylight Time,
kb8uih@arrl.net writes:

> Is the UI view good for all around for APRS

It's a full featured APRS program with mapping, igate functions, messaging,
TNC support including the AGW Packet Engine soundcard software TNC.

> and not just a digi program?
> What maps does it interface with?
>

It doesn't "interface" directly with any. You have to supply it bitmap
graphic images in GIF, PNG or JPG format of maps produced by other
applications, along with a configuration file that identifies the lat/long
of the upper left and lower right corners of the map image.

Two auxilliary programs are available for use with UI-View. One, SA Map
Grabber, which comes with UI-View32, will do screen caps of Street Atlas USA
maps and automatically generate the corresponding cal file.
The other, MapTool will fetch and save a map from the Mapblast website
(the same type you see on Findu) along with a matching cal file. You tell
Maptool what lat/long the center should be and how many miles across; it then
automatically sends the request over your Internet connection to Mapblast,
retrieves and previews the map in your web browser, and then saves it. The
Mapblast website can produce maps for ANYWHERE in the world so if you need
maps for non-US areas, this is a valuble tool.

The third (big bucks) appoach is to use UI-View's add-on UI-Point that will

let it plot positions on Microsoft's MapPoint program. This is a fully
scalable and zoomable vector-based mapping program similar to Delorme Street
Atlas but much more expensive and much more sluggish and resource-hogging.
One attraction of MapPoint is that it includes street-level detail in Canada
as well as the U.S. and major roads in Mexico. Another neat feature is the
ability to switch it's display from the usual flat roadmap- type display to a
textured raised-relief-looking physical map presentation.
    WARNING: You need a lot of memory (recommended minimum 128MB) and
processor horsepower (400MHz or greater) to do this though since you need to
run THREE programs at once: UI-View32, the UI-Point "glue application" AND
the powerhog MapPoint.

Rendered body type: text/plain

OK- I'm finally going to break down and buy a TH-D7a(G) at Dayton this
year. I have a garmin emap that I use in the truck with my mobile 50W APRS
setup. Has anybody used the emap with the D7? I like the idea of having a
mapping gps avaiable for use with the D7. Hopefully, the HT will output
stations as waypoints for display on the emap screen? I think I read this
somewhere.

I'd like to use the HT for aprs on my bike, as well as while hiking. Any
other thoughts about aftermarket antennas and extra batteries? Any advice
would be great.

\>would be great.

I purchased the Pryme long whip, and I'm very pleased with it's performance. Be aware that you don't want to change antennas often. The Kenwood uses an SMA connection for the antenna, and while it gives good performance at UHF, it doesn't like having the center pin twisted in and out (which is what happens with screw-on antennas). I've heard reports of the connector failing after 100 insertions.

As for batteries, I bought one from Mr. Nicad (or whatever he's calling himself now that works well. Don't use the belt clip on the batteries. Spring for the case.

I was suprised to hear discussion about this. I had emailed someone (can't remember who right now) and he told me the that the pizza meeting had died out several years ago, so I thought this wasn't even in anyone's heads.
I'm all for it. As long as I can find the place, guess I better break out one of the Garmins. Long/Lat anybody? :o)

Personally, I'm trying to pack in as much stuff at Dayton as I can, more the better, no complaints here.

I think the KPC3+ will work as a regular TNC and as a digi at the same
time. Or you could run the KPC3+ in KISS mode, set Linux up to handle
the AX.25 stuff and run both aprsd and aprsdigi.

Hi Shannon,

Answer to your first question is 'yes'.

The KPC3+ has one, real serial port and a radio port. With the V8.3
firmware, some of the pins on the radio port can be used to receive
serial data from a GPS receiver - a 'virtual' 2nd serial port. The
firmware has the commands so you can select what NMEA sentence you want
to use, how often to send it out, what paths to send it via etc.

The real serial port is then free for you to use for 'conventional'
connections. Hook up your laptop, use software, do normal connected mode
packet - whatever you want. When you're done - just ensure the KPC's
settings are correct, un-hook the serial cable and let 'er be. One
'dumb' tracker back in operation.

The manual on the KPC site will give more detail

Oh yea,

I do it all the time here. Just setup the KPC's parameters to be the
digi you want it to be - then serial connect apsrd to do the
server/I-gate role. Works well.

One thing, I'd limit what extra stuff aprsd sends out over the air -
maybe just leave the BTEXT in the TNC - up to you.

What is an HPC cable? Do you mean HSP? You don't need an HSP cable or
anything special with the KPC3+. Just connect the GPS Rx to the radio
port and the laptop to the regular RS232 port.

Okay, the voting so far has been 30 in favor of Marion's. And 2 not in
favor so far. So, I will go ahead set the arrangements up this afternoon
for Saturday, May 18th at Marion's Pizza. I will look into a different
meeting place for next yr. I have chatted to some of my co-workers that
work out of the Dayton terminal for my company. And we might be able to
do it there which it will be even closer to hara arena. And I was also
told that if you want a good place you have to book at least 6 months in
advance. I will agree Marion's is loud, but this is something that we
just have to deal with.

Thanks to those that had positive feed back, and I'll posted more
information as I get it.

Also flyers will be available at the APRS booth for anyone else that
might be interested in joining us.

Maybe 3-4 years out of date but better than the alternatives that we have
for maps.

I like other versions of APRS myself at times but I always go back to
WinAPRS due to the ability to use
PMap. Maybe some roads are not on there but all of the ones I care about
are, so what if there is a new road,
at least we know within a block or two where the station is.

I also like MacAPRS which is the same as WinAPRS but I never use it since I
would need to revert back to the
original low res maps. And yes I know we can make better maps but we can't
come close to PM in the way of landmarks
and other map features.

If we ever could have Pmap type maps in Xastir or MacAPRS "Billy Boy" would
be out of this house!

Rich

Hi,

First, thanks for taking the time to read this message and possible provide assistance. This is what our hobby is about.

I bought the above unit via the list a few years ago. Sadly, medical problems prevented me from doing much with it until now.

I have hooked it up and it responds appropriately to commands, but it only provide the last location where it operated, hundred of miles form my QTH.

It is working as far as I can tell and continues to give the old position in the correct format every few minutes. The antenna is in the clear and other antennas have not helped, nor made it worse. It just does not seem to be hearing the satellites, or needs to be reset.

Any help is greatly appreciated

Bob

Might consider the J-Pole like antenna made from 300 ohm twin lead, a
bit large for headmount, but it could be suspended fron the bike's flag
pole and doesn't need a groundplane.

You didn't say what you are using for an antenna ... so I assume it
is the
HT's rubber duck. You'll get the most "bang for the buck" with a
better
antenna mounted on the bike if possible. I used to run bicycle
mobile (not
APRS) and had a regular mobile antenna (Larsen 2/70 dual band whip)
mounted
to my luggage rack. I know of others who have attached a J-Pole made
of
pipe to their bikes.

For those who say you'll need a proper ground plane for a mobile
antenna to
work, remember that some mobile antennas are 'ground independent'
and
also, no matter how bad it is, it's got to be better than the rubber
duck!

I realized 30mile coverage with a roll up j-poll made from 300 ohm twin lead,
using my THD7-A. It works great for me!

I'm using a "Jurassic Duck" that WX2NJ wrote up. Haven't gotten my bike mobile APRS going yet, but it's made a world of difference on voice.

You "could" convert a bike bottle to a battery case, assuming you use a hydration pack to take it's place so you don't fall over dead from dehydration. That's the system I'm using now.

Future plans are to move the handle bar mounted HT to the tail rack bag, mount a TripMate/Tiny Trak to it's old mount, connect them together with some nice black Cat-5 cable I found, and plug my boom mic into that. I'm going to go through a voice repeater with a TNC/Radio at home to parse out the APRS signal and digi it back onto the APRS freq. Should make the trip with no problem that way.

> New - "Finger" lookup of NWS data from Dale Huguley, KG5QD's NWS server.
Via an Internet connection, right click on any warning, and select the new
topmost option, "Finger Weather Server".  This select the first 3 letters of
the From callsign, and "fingers" it via Dale's server.  Also added is a
Finger button on the NWS tab.  Clicking the button will present you a small
editbox just below the button where you can enter the 3-letter code of the
NWS office you are interested in.  Pressing Enter, or the Esc. key, or
clicking outside the editbox will cause a Finger lookup, provided you have
entered a 3-letter code.  More or less then 3 letters will not trigger any
action.
>

Correction, less than 3 letters will not trigger an action.   Finger
"fingerhelp"   to see a list of options.

792. [aprssig] Garmin Extrex Family

From: "Mike Wolthuis" <wolthui3@msu.edu>
Date: Tue, 23 Apr 2002 10:45:13
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-75968-2002.04.23-11.19.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hello Everyone,
I am looking to aquire a new Garmin GPS for portable use with my D7A.
It appears the Extrex line of GPS models is perfect, but I have some
unanswered questions:

1) Can someone break them down (Looking at Venture,Legend,Vista)
      ie. Do all support NMEA in?  I want to plot calls, this is a big
thing, also I know only Legend and Vista have mapping which is why I want
to get one of thoose if they support NMEA in.

2) Any thoughts on good/bad experiences.

I really like the Legend and if it supports everything the Venture does,
plus it has the 8MB memory, but I need to know for sure it takes NMEA in
and someone has done it, if not I guess I will go with the Venture pry.

Thanks all,
Mike Wolthuis

```
> From: Michael Bass <mbass@amgen.com>
> What is the lightest aprs tracker possible?

    I'm probably not the best person to ask since I
tend to bring even the kitchen sink even on short rides.

> All of this equipment is located in my jersey pockets --
> the three pockets on the back of a cycling jersey.

    I use a D7Ag with an eTrex Legend. The eTrex is
velcroed to top of my NiteRider headlight. The D7 is
in my Camelback (if you don't have one, you should;
hydrate or die!). I'm using an aftermarket antenna
(Comet, about 18 inches long, I forget the model)
which puts the bulk of the signal above my head and
not into my lower intestines as it would in the jersey.
    Even at five watts, the D7's battery will last
longer than I do. I can easily get six to eight hours
worth of riding in before I have to worry about
swapping batteries.
    I have run bicycle mobile around central (Orlando,
Daytona), Southeast (Palm Beach, Jupiter) and South
```

(Keys) Florida with good results. My definition of
'good', by the way, means a packets every half an hour
making it to the internet stream. My mobile TX rate is
every three or five minutes depending on what sort of
pace I'm running. Not a great success rate but about
what I'd expect for 5W mobile be it bicycle or automobile.

> Since I ride a road bike, installing a D700 and
> battery is out of the question.

Unless you're a weight weenie, that's not true.

Check out this guy's bike...
http://ourworld.compuserve.com/homepages/bcotton/tripmate.htm
He has a GPS and laptop attached.

Here's a guy who rode 2,500 miles with his solar
powered laptop on board...
http://www.kenkifer.com/bikepages/touring/laptop.htm
Add a wireless modem and you've got a great setup.

I have a NiteRider Digital Pro12 for lighting.
(Living in Florida, I find it painful to ride while the
sun is up in the summer so I take to the trails at dusk
and ride the final couple hours by headlight.) It has a
4.5AH NiMH 12V battery that fits in a standard water
bottle holder. Here is what they claim for runtimes...

- 7:00hr @ 6w
- 4:55hr @ 9w
- 3:35hr @ 12w
- 2:15hr @ 20w
- 1:25hr @ 32w

Since it's lighting, that's continuos draw. For
kicks, I tried to power my D700 with the battery. It
worked just find at low and medium power. I was too
chicken to crank it up to the full 50 watts. (Mount
the D700's head to the handlebars and the unit itself
in your bike bag and you'd have a rocking setup.)
So, if you're looking for a fairly lite, powerful
battery that is designed to work on a bike, you might
want to look to NiteRider or some of the other folks
who make bicycle lights.

Mike,

I have two eTrex units. Here is the response.

>>>1) Can someone break them down (Looking at Venture,Legend,Vista)
ie. Do all support NMEA in? I want to plot calls, this is a big
thing, also I know only Legend and Vista have mapping which is why I want
to get one of thoose if they support NMEA in.<<<

Yes, they all are capable of sending NMEA to the tracking module from the
basic Yellow model on up. You do have to change the setting as the
standard setting is "Garmin". I do not know if they support NMEA into the
GPS unit.

2) Any thoughts on good/bad experiences.

I really like the Legend and if it supports everything the Venture does,
plus it has the 8MB memory, but I need to know for sure it takes NMEA in
and someone has done it, if not I guess I will go with the Venture pry.

As you go up the line, the units support everything the previous model
does, they just keep adding features.

I have the basic Yellow model feeding the KPC3+. For Geocaching I use the
Venture since it stores all the waypoints for tracking down multiple caches
on a weekend.

> From: "Mike Wolthuis" <wolthui3@msu.edu>
> It appears the Extrex line of GPS models is perfect,

I'm a huge fan of Garmin. They are always updating their products and have excellent customer service. Even when I was boneheaded and gave my Legend 12V instead of 3V, they swapped it out without question.

> 1) Can someone break them down (Looking at Venture,
> Legend,Vista) ie. Do all support NMEA in?

Yes. At their most basic level, they are all the same. The only real difference is memory and extras. All of the eTrex models do NMEA in and out.

> I know only Legend and Vista have mapping which is why
> I want to get one of thoose if they support NMEA in.

I bought a Legend nearly a year ago and love it. (I talked my father and a co-worker into Legends, too.) However, if I had to do it again, I'd get the Vista since it does everything the Legend does but has 24M of memory instead of just 8M.

I like to load maps. With 8M, I can load only half of Florida from the Roads and Recreation CD (pretty much just roads, parks and whatnot). If I use the MetroGuide CDs (includes everything in R&R plus street addresses and business information), I can only load a county or two.

That said, I love to drive and my idea of a good vacation is doing a 5,000-mile road trip in a couple of weeks. So, I want to be able to load a lot of country into the GPS at one time so I don't have to reload after every day of driving. If you don't cover as much ground, 8M may be plenty of map for you.

Except for the ability to load more maps, the Legend is just as good as the Vista.

The Garmin web site (www.garmin.com) has a great tool to compare GPS models. I suggest you dial up your three GPS choices and compare them feature by feature. I don't think you'd be making a mistake with either the Legend or the Vista.

Comment:   RE: mapping with any eTrex ... the screen is *really* too small
to be easily seen _while_driving_    If you have someone riding "shotgun"
that's one thing, but to have to look at the screen yourself, while driving
is another.

I use a Garmin III and while it's screen is bigger than an eTrex Garmin has
other units with bigger screens still.

Oh yeah, I remember somebody out there that's made an antenna out of piano
wire, too.  Just wish I could remember who it was.  But in any case,
shouldn't be difficult to come up with something from scratch.  That would
give a lot less drag, but it won't give you a place to fly an idiot warning
device from.

Build a very thin 19-inch whip out of something like piano wire and mount it
on the bikes frame. (The weight and drag will be insignificant.)    Or even
better, mount it on the top of your helmet.  Feed it with RG-174 or similar
```

```
ultra thin and light coax.  The increase in radiated signal strength will be
enormous!

If you do that with piano wire...

Take a plastic ball, anything, about 1/4" or more diameter, and melt the
end of the wire into it.  Especially if you put your antenna on a bike
where
you might 'bend over' into the antenna...  It's not a good idea to forget
that
you have a sharp wire sticking up, almost invisible, right about eye
level...

Rendered body type: text/plain

Also of note: the Vista has a magnetic flux compass, which is what it takes the course/heading information from, unless you are going faster than a user-settable speed. The Vista also has a barometric altimeter for altitude instead of the GPS 3-D fix altitude, though the barometric altimeter is frequently calibrated with the GPS fix to take care of slow variations in barometric pressure.

The Map CD-ROMS that let you download data into the Vista and Legend models are (in my opinion) a bit expensive, but a feature on the garmin website lets you look up any area on any of the cd-roms to see what kind of coverage they offer for that area. Sort of a try-before-you-buy. This was important to me, since I live in a somewhat small town and wanted to be sure that I was actually buying more detail than the basemap already in the devices.

You're darned skippy! That's the real reason why all of our military
antennas have that tear drop on them. Too many mechanics were getting
injured walking into tied down antennas....

Jack

If you do that with piano wire...

Take a plastic ball, anything, about 1/4" or more diameter, and melt the
end of the wire into it. Especially if you put your antenna on a bike
where
you might 'bend over' into the antenna... It's not a good idea to forget
that
you have a sharp wire sticking up, almost invisible, right about eye
level...

Mike

A metal "ball" on the tip on an antenna is better. Mobile antennas without
metal "balls" (they don't have to be round) show increased static electric
charges over those that do.

Re. to making an antenna out of small wire 18" long.....sounds like a
"Hershey Kiss" dual band mag mount! A single black wire (1/16" dia) on a
magnet the size of a Hershey Kiss with the 1/8' dia coax terminated with a
BNC connector. It's a VERY strong magnet!

Modern day mop handles are made out of very lightweight ferrous metal.  I
mounted one from the back axle up about 4 feet and flattened the last 1"
and bent that tab horizontal.  It makes a perfect mount for the little
super tiny piano wire mag mount antennas you can now buy with the
mini-coax...  ANd it is very lightweight but  puts the antenna above your
head.

With the magmount, it is a multi-use system and the only investment in the
bike configuration is the throw-away  mop handle.  You can use the little
magmount for many other purposes.

A coaxial J-pole tied to a fiberglass bike flag works great. It's a 1/2 wave
antenna so no ground is needed.   It's up nice and high for good range.

I'll get the details for the coax version of a J-pole on the web real soon now. It's
a great way to recycle a piece of RG-58 ethernet coax.

Here's a pre-trip picture:

811. [aprssig] Re: Need Help with Motorola XT ONCORE GPS Receiver

From: Gary Hinton <ghinton@eng.mcd.mot.com>
Date: Tue, 23 Apr 2002 13:24:04 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@lists.tapr.org>
Message-ID: <LYR842-76006-2002.04.23-15.58.02--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Bob,

It sounds like the receiver is not acquiring a new location, for some reason.

One way to check for this is to look at the data string it sends out. Here are
some lines sent by such a receiver.

```
R156>GPSLA,TRACE3-2:$GPRMC,062221,V,3329.5347,N,11155.2617,W,0.000,0.0,150400,12.3,E*4B
R156>GPSLA,TRACE3-2:$GPRMC,062421,V,3329.5347,N,11155.2617,W,0.000,0.0,150400,12.3,E*4D
R156>GPSLA,TRACE3-2:$GPRMC,062821,V,3329.5347,N,11155.2617,W,0.000,0.0,150400,12.3,E*41
R156>GPSLA,TRACE3-2:$GPRMC,063131,A,3334.9478,N,11150.1572,W,0.000,0.0,150400,12.3,E*52
```

It always sends the same location until it locks onto and acquires a new location.
This is indicated by the A instead of a V, right after the time stamp at the
beginning. The lines that come after this should always have the A in them and
should show the current location.

Hope this helps. I am not sure what to do to make it work better. Maybe
you can share with us what it is sending.

In Central Iowa, most users with Kenwood D700's use the -7 SSID, that
way it gives you and idea of what capability they have, such as
messaging etc., just by looking at the SSID.

Josh:

See http://nwaprs.org/symbols.htm

Based on that site, it looks like some software used the SSID to indicate
which of 16 symbols to display a station as.  I know I've seen -9 used on
more than one occasion, and wondered why.  I searched and found the above
website.  -9 means "car".  I guess I'll change my to -12 (Jeep).  (-7 means
"aircraft"!)

In the earlier days, the ssid was how you were associated with an icon.  Today
it can be handled differently but the ssid is still a valid method.  Bob even
mentioned altering it to act as a way to manage paths.

These only come into play if there's nothing else in the packet to
determine the symbol from.  The only case I can think of right now
is a TNC spitting out $GPGGA or $GPRMC GPS sentences.  In that case
there may be nothing to select the symbol except SSID or one of the
two alternate methods below:

1) Set the destination address to determine symbol.
2) Put the symbol inside braces? in the status field.

I'm not sure which methods are decoded in which flavors of software.

But SSID only implies an ICON when the packet transmitted is a raw
GPS NMEA string.  Otherwise it means nothing.  But for simplicity, most
folks stick to these major conventinions for easy observations:

-3 is via satellite
-6 is when you are doing somethign extra special like FD or something
-7 is a THD7 or D700
-9 is a mobile
-14 is a 18 wheeler truck

The reason it is a good idea to not flip them about is becaues the
FINDU.COM maintains all data by call and SSID.  This is the main reason to
make sure you always use -6 (or any unique) SSID when trying a satelite
contact so that you can tell later on if it was via satellite or heard
terrestrially.

If you make a satelltiee contact via a satellite using one SSID and then
without changing the SSID switch back to terrestrial, FINDU.COM wont konw
the difference and will overwrite the satellite packet with the more
recently heard terreswtrial packet... etc..

Bob

well, thanks to the help of a few people with the KAM settings (soon to be
the KPC 9612 settings), (I messed a few things up in the course of initial
setup) W0EEE-3 is now digipeating AND showing up on the map, so there is
now a Digi up and running in Rolla, MO. Hope it helps to fill the hole
along I-44 out of St. Louis.

A better idea to avoid injury is to use needle nose pliers to form a very
small loop in the end of the wire. I then dip the loop in Plasti-dip that
was designed for covering tool handles. This forms an almost impossible to
remove covering. I have seen plastic balls fall off, get pulled off by
tree branches, or break off in falls. The loop does not seem to cause any
SWR problems and if properly formed eliminates the injury potential. It is
also possible to use a 1/4 in drill bit and make a 3 1/2 turn coil at the
bottom to create a dual band whip. I used some silver solder to connect the
whip to the center pin of a clamp type BNC and the insulated it with hot
shrink tubing and epoxied it all together after tuning. It works great and
is rugged as hell.

820. [aprssig] Bad packet?

From: Steve Jones <sdjones@sympatico.ca>
Date: Tue, 23 Apr 2002 20:22:25 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76021-2002.04.23-19.57.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've been having problems with my Hamhud locking up lately. The last packet displayed before it locks up is always from WD8EJC-10.

I checked www.findu.com and captured these three packets:

```
WD8EJC-10>BEACON,W8LRC,WIDE3:=4046.20N/08409.60W#PHG746.51[B

WD8EJC-10>BEACON,WIDE3-1:=4046.20N/08409.60W#PHG746.51[BN8XOS-8>T1RT3X,WIDE
2:'mEbl j/]"6d}

WD8EJC-10>BEACON,WIDE3-2:=4046.20N/08409.60W#PHG746.51[BKB8DPN-3>T1PY9X,K8U
I-1*,WIDE:'m+Dn|d-/]
```

All appear to be badly mangled. The PHG looks to be either incomplete (aren't there 4 digits normally?) or it's been mangled somehow. I don't know where it's been mangled though. It is possible that I have been hearing Randall's packets direct through RF though.

Any ideas? I'm hoping Randall can check his system and make sure the outgoing packet is mangle free.

Rendered body type: text/plain

So if this is the case why does my car show up as being a house that moves? Many folks in the New York area have commented/complained about this. I use an SSID of -7. I have a TT2 and a Garmin GPS. My TT2 is configured to send an SUV symbol. It also send the packet out in compressed format

This only happens with folks using WinAPRS. DOS and Linux users see it as it should be. Have we spotted a bug in the WinAPRS software? Is it only paying attention to the SSID and not the payload symbol?

FYI this was the last raw packet gated through to Findu a few minutes ago.

```

Digis and IGates are different things, few digis IGate. An IGate could
never have too good of a coverage pattern, and it is unlikely that
there would be too many of them. The only QRM potential is in messages
sent out from the internet to RF. You would want to have perhaps two
IGates in the general area feeding messages to RF, if there are more
there should be some sort of coordination, those with the most
reliable software and internet connections should be chosen. Even
those that do need to shut down should simply have their RF transmit
side disabled, there is no reason to ever cut out the RF to internet
feed.

PHG is always 4 digits. At least, in the standard they are. But some
people don't read standards, so things like gain (range 0 to 9) might
get entered in a manual beacon as "6.5" instead of either "6" or "7".

I'd expect the character that is "mangled" is an Escape, as part of a
terminal back-arrow sequence, used when someone MEANT to hit
"Backspace" (to delete the bad PHG value), but it was loaded into the
beacon string instead. Probably LOOKED right on their terminal
though...

Subject: [aprssig] D700A TimeStamp problem

I just put a new D700A (well I bought it few months ago)on the air in
our
new Ford Explorer for a trip to Maine this past week and I am seeing
something strange on the timestamps in message and list. The time
doesn't
seem to 'roll over' ... that is, I get times like 26:12 and 30:04, If I
go
to the POS screen and punch "settime' everything is cool but if I leave
it
on all day through a GMT rollover , the times get screwed aagin. It
never
happened with my other D700 so I am quite puzzled!

Has anybody seen this? What have I overlooked?

cheers ... brian, n1bq

832. [aprssig] Extra Dayton rooms available

From: Ralph Fowler <rwf@mindspring.com>
Date: Wed, 24 Apr 2002 00:33:57 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76080-2002.04.24-00.09.34--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've 4 extra rooms for the Dayton Hamvention.
They are at a reasonably priced 3 year old major chain Motel, not too far
from the Hamvention, and are for Thursday Friday and Saturday nights
They are all double rooms (2 beds) and are in the non-smoking section.
Please Email me if you desire one or more of these.
I can't remember, but I think they are 80 or 89 $ plus tax, per night

```
The original question and statement was about WinAPRS.
Precision
> Mapping is not WinAPRS, and WinAPRS HAS been updated much more recently
> than "years" ago.
>
>          Earl

But PM HAS been updated (I think they're up to 4.5 or 5 now) and WinAPRS
has not been updated to be able to use the newer versions.  My biggest
complaint on PM 3 is that the names of the towns are almost all wrong -
or not there - or in the wrong location.  When will we see WinAPRS work
with a decent version of PM?  When will DFing be fixed in WinAPRS?  I
really like the way it works much better than APRS+.  But I have to
revert to APRS+ for fox hunting (because DFing doesn't work in WinAPRS)
and navigation (because of the wrong town names in PM)

Bob writes with much wisdom in his reply.  His number 2 point is the key.
When Sid, NH7C, moved from his appartment complex back about 97ish we lost
access to his party room.  Marion's was the only place we could find on
short notice that didn't want a deposit or exact head count to size their
serving staff.  Although we arranged to use their private room the first
year, it filled up pretty fast.  I think that's why Sid went with the open
seating area the following year.  Yes it's noisy and it's not my favorite
place to eat in this area, but the "pay as you go" arrangements are perfect
for this APRS group.  Now if one of you would like to volunteer a credit
card number and hope to collect from all attendees we can do some fancy
dining in a private room somewhere in the area.  When I attend these events
it's for the fellowship.

Someone asked about GPS coordinates for Marion's.  If you have the data
available from 1997's Hamvention the GPS coordinates were broadcast on
Friday and Saturday that year.  If anyone really needs them I can get them
again and post them here.

I'll do what I can to help James Smith prepare for this event but
unfortunately I can't make Hamvention this year.  You folks have fun!

Bob

You have to manually set the time offset from GMT in the radio.  It's somewhere
within the menu's but I can't remember where since I only use that function
twice a year.  The GPS outputs the time in GMT.

> thinking about shutting it down.

Well, I think it is much better to not shut it down, but simply QSY the
output.  In fact, if you were really lucky, a good output freq would be
144.39 + 600 or 145.99 if it is not already in use.

Thus it still can hear everything, it still can be heard by anyone that
wants to, and anyone can use it exclusively by going to a + offset.  In
our area that freq is reserved for Packet (but I dont know if it is
currently claimed)...

In fact, since only the BIG WIDEAREA machines are in this situation, and
those are widely separated, then it might seem that all such WIDEAREA
machines could do the same thing, since someone on the ground would surely
only be able to hear mostly only one of these...

Good luck.  I think I will start monitoring
144.99 to see who is there...

Bob, WB4APR

        Now will you continue to argue that WinAPRS hasn't been touched
"in years" when the latest WinAPRS.exe is dated May 16,2001, less than a
year ago?

         Or perhaps you haven't downloaded a new copy "in years".

I knew I saw those somewhere! You should be able to
get those mounts from any cellular store that does
installations. That is what they where originally made
for. I think Tessco has them also.

Here is the link to panavise site
http://www.panavise.com/f/comm/indash/index.html

They really do work great. My only complaint is that
some models are installed just into the pathway of the
passenger air bag.

Ryan

Brian,

Been there...done that. The D700 does seem to have this little problem. Mine had it when I purchased it and also again when I got it back from Kenwood when the FET front-end on the two meter main receiver died. Here's the fix:

To do a master clock reset (which seems to take care of the rollover problem), press REV+LOW+POWER ON from the OFF mode.

You can find this info in the Kenwood Service Manual and also in the lower right corner of Page 12 of the "Specialized Communications" Manual that came with your radio.

Good luck.

Rick - K6TVI

it worked yesterday, really it did!! well, we had some power failures here, and i dont know how well the battery works in my KAM....it was ok today when i reset it, but i had to reset all my settings again this morning.. I hate getting phone calls at 1AM asking how to reset the digi... told em to just shut it off, so EEE-3 was offline until 9:50 this morning. Luckily Eudora keeps all my email on my HD, so Im only missing one setting that someone gave me over a repeater last night....i remember most of it, but i think something might be wrong with it....

aaannnyyywwaaayyy.... what is the recommended setting for UNPROTO? would it be "UNPROTO APRS VIA WIDE" or "UNPROTO APRS VIA WIDE3-3" or.....

help?

thanks
Ken

Rendered body type: text/plain

We're very happy to announce that Bdale Garbe, KB0G, will be the keynote speaker at the TAPR/MVFMA Digital BASH on Friday evening at Hamvention.

Bdale is one of the long-time "good guys" in the digital radio and amateur satellite worlds. He was in the middle of the early work on KA9Q's "NET" and "NOS" programs, pioneered megabit-rate packet radio, and in the satellite world was heavily involved in the RUDAK and AO-40 GPS experiments. Back in the Old Days, he was a board member and Vice President of TAPR, and remains one of TAPR's best friends. On a different front, Bdale was just elected as Debian Project Leader, so he now oversees one of the major Linux distributions -- and the one that is by far the most ham-friendly. Bdale works in the Linux development group at HP, and in his spare (?) time does VHF/UHF/microwave contesting and roaming.

Bdale's talk will blend all of these interests into an entertaining and informative presentation titled "From Bits in the Basement to Debian -- and Back Again".

You can find more information about the Digital BASH and TAPR's other Hamvention activities at http://www.tapr.org/tapr/dayton/.

See you there!

73,
John

Ken, the easiest way is to hook a 'puter with a
terminal program (or a dumb terminal) to a
TNC. Tune the associated radio to 144.39
and watch !

What a choice for a first time attendee. I didn't realize that the Pizza was
scheduled for the same time as the Banquet. When I ordered my tickets a
couple of months ago I ordered the banquet tickets also. Maybe I'll scalp
them and make the Pizza bash. Anyway I'll see everyone in Dayton.

73,
Dave N0EOP

He's not talking about the TAPR banquet, he's talking about the main Dayton banquet. Actually, holding the Pizza thing on Saturday is a really great idea. I'm not really keen on large formal banquets, and in fact, I've been going to Dayton for almost 20 years and don't really know anyone who regularly attends the Dayton banquet. I'm not being critical of the Banquet, its just that I've never met anyone who's actually attended it. However, for some years there was not much of anything else to do on Saturday Night because no one wanted to schedule anything opposite the Banquet. The idea of holding something less formal and doing it on Saturday night is fairly revolutionary and really a good idea.

BTW, I would second the idea of finding a good BBQ restaurant, but I suspect that's going to be difficult.

Uh, James, which banquet are you talking about? The Hamvention Banquet is (and always has been) on Saturday night of the weekend. There are other get togethers on Friday night, so maybe that's the confusion.

I just double checked the Hamvention site (http://www.hamvention.org/) and made sure the banquet hasn't moved.

863. [aprssig] New Canadian Pocket APRS maps!

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Wed, 24 Apr 2002 21:09:04 +0200
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76223-2002.04.24-15.00.00--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello All,

For your information.

There are new PocketAPRS maps for Provinces of Canada which is also usable with APRS/CE, Xastir, MacAPRS 3.5.2 and WinAPRS 2.5.2 (Haven't seen this one released yet, Keith tested it a few months back) or better.

A Canadian ham asked me if I could convert the splendid APRS maps for the Canadian provinces by VE3ADJ and VE2AW. Both authors gave permission to publish the converted maps (and allowed me to convert even more, which I might do some day).

These are about the best maps I've made to date. Not only because my conversion tools finally handles labels and can insert dummy points in long vectors (allowing more accuracy), but also because of the very good source material of VE3ADJ and VE2AW. As with the Dutch map these maps use layering - showing more detail as you zoom in. So don't be disappointed when you look at the maps at 1x zoom, but zoom in and be amazed! Also the more you zoom in, the more labels show up on the screen.

Canadian maps:

File	Province	Source
marc.pdb	New Brunswick, Nova Scotia	VE3ADJ
pqhighw2.pdb	Quebec Highways	VE2AW
nontc.pdb	Northern Ontario	VE3ADJ
sontc5c.pdb	Southern Ontario	VE3ADJ
smb1.pdb	Southern Manitoba	VE3ADJ
ssk.pdb	Southern Saskatchewan	VE3ADJ
sab2.pdb	Southern Alberta	VE3ADJ
sbc2.pdb	Southern Brittish Columbia	VE3ADJ
yukon.pdb	Yukon Territory	VE3ADJ

Every time I work with pocketAPRS maps it surprises me over and over how efficient they are. All the information from the original map is present but the size is still low. All the provinces fit in a ZIP file of about 1 MB. So I hope the author of pocketAPRS will attract a lot new customers due to all these maps!

You can find the new maps, with other maps, on:
http://www.homepages.hetnet.nl/~pe1dnn/
(You may have to reload the map if you have a cached copy).

Kind regards,

Henk.

Didn't TAPR used to have their McNasty's get together on Saturday evening?

But I do agree with you that something more focus'ed and hands on is much better then the banquet. Did you see TAPR is having Bdale Garbee as a speaker on Friday? This should be good.

Maybe I am missing something here but are we not jumping the gun here ?? By what I saw in the original post the author had a digi at 600ft in Manhattan, knowing the area somewhat since I grew up in the "since changed" skyline of NYC and visit on occasion I know that there are not TOO many digi's in the area. Just because there is a digi at 600ft there is much more info needed before the "plug is pulled" on .39.

1) What other digi's are in the area
2) How good are the other digi's (no 50ft digi's please)
3) How well do they cover the Manhattan area
4) How well does this 600ft digi do considering a RF Mess like NYC
5) 600ft may not be all that much depending on what else is around it, shadows, blocking etc.

The only digi's that I know of in the area is West Orange and Staten Island. I just brought up AHUB East and using Pmap all I see is the NYC Linux Igate, ANOTHER ONE 13 miles west in West Orange and the closest digi is in South River about 30 miles to the South West.I know that N2MH had a digi up but I think he is only a Igate now, and on LI I see a WIDE/NODE icon but it also shows at 20ft. With Staten Island and West Orange Digi's gone that only leaves Mark's digi up and on the air servicing a VERY LARGE population area.

South River at 30 miles away is only at 40ft and the Sproul's Neighbor Scott's digi is at 160ft 37 miles away and Stan's Digi in CT at 83 miles away.I have always said that there are no hard and fast rules in communications, we need to use good judgement. Nothing is high and nothing is low it all depends on the enviroment. A digi at 40ft is a WIDE if there is nothing else within 50 miles or so but a digi at 200ft should also not exist if there is another one 30 miles away at 1600ft!

Change the output of this 600ft digi and all the D7's and others driving through NYC Metro area will not see a thing.

> thinking about shutting it down.

Well, I think it is much better to not shut it down, but simply QSY the output. In fact, if you were really lucky, a good output freq would be 144.39 + 600 or 145.99 if it is not already in use.

Thus it still can hear everything, it still can be heard by anyone that wants to, and anyone can use it exclusively by going to a + offset. In our area that freq is reserved for Packet (but I dont know if it is currently claimed)...

In fact, since only the BIG WIDEAREA machines are in this situation, and those are widely separated, then it might seem that all such WIDEAREA machines could do the same thing, since someone on the ground would surely only be able to hear mostly only one of these...

Good luck. I think I will start monitoring
144.99 to see who is there...

One more thing, I just noticed that another WIDE poped up 6 miles north of
the 600ft digi at 160ft now in this case
which one should be the WIDE?

I know what I think.. Does everyone else agree ?

If we had the cellular backbone approach implemented then yes, 6 mile seperation is fine as long as the high digi's are the primary and low ones are on the backbone not on 144.39 but this is not the case yet.

Speaking of backbones there is a effort to work the FPAC software for APRS backhauls at this time. Maybe others that work with FPAC can join in but we need the assistance of all the APRS authors on this one.

Rich

There's several things becoming confused here. What used to be at McNasty's was the "Bash". In recent years it was held at the NCR conference center and has apparently been moved to another banquet facility. It generally has somewhat more of the look and feel of a banquet than a casual get together. For example, there is generally a speaker. This event has always been held on Friday. I've not been able to attend it for the past few years, but I think you are correct, getting Bdale to speak is a significant draw.

The Dayton Banquet is huge. It is directed at a more general audience. It is always on Saturday.

The APRS get together is a much more informal thing. Folks show up order pizza and beer and talk. Generally there is an attempt to introduce everyone and let people make any kind of announcements they might like, but there's not much in the way of a formal presentation. It is also held on Saturday Night. As APRS becomes much more than simply a geographic location system, I think it would be great if folks who were interested more broadly in digital communications attended this. An argument could be fairly made that it is either outgrowing, or has outgrown the facility in which it was located last year. However, I really like the informal atmosphere, and the ability to just go order some food and drink rather than having a set meal.

Has anyone heard whether Kenwood is holding their thursday evening wing ding this year or not?

Well all, it is all set up for the 9th annual APRS Dayton Hamvention get together. Marion's has once again aloud us even more space than we had last yr., I couldn't get them to close it off to the public though. But hey, for them to help host this and not change us any fee for a place to meet, chat, eat or whatever you can't beat it. I will be looking into something different next yr. since APRS continues to grow at a fair pace. And I will be looking at the cost of another facility for 2003. And that brings up several other question that can be answered at a later date.

Stan, was quite nice last yr. and generated a map for the location of Marion's which will be available at http://www.tapr.org/~wa1lou/2002/2002.html and at the APRS booth of 223, 224, & 225 informational handout.

Here is additional information.
Marion's Piazza
3443 North Dixie Drive
Dayton, Oh 45414

So set your calendar for May 18th from 6 PM - ? and join us at Marion's.

>
> A Canadian ham asked me if I could convert the splendid APRS maps for the Canadian provinces by VE3ADJ and VE2AW. Both authors gave permission to publish the converted maps (and allowed me to convert even more, which I might do some day).
>
> These are about the best maps I've made to date. Not only because my conversion tools finally handles labels and can insert dummy points in long vectors (allowing more accuracy), but also because of the very good source material of VE3ADJ and VE2AW. As with the Dutch map these maps use layering - showing more detail as you zoom in. So don't be disappointed when you look at the maps at 1x zoom, but zoom in and be amazed! Also the more you zoom in, the more labels show up on the screen.

Nope, even that clarification's not (quite) correct. McNasty's was an informal packet event that died out five or six years ago. It was never directly sponsored by TAPR, though there were very strong connections between TAPR and the folks who attended. McNasty's was (I'm pretty sure) on Friday night.

The BASH is one of the longest-running Hamvention activities -- it started as the FM BASH back in the 70s, and became the Packet BASH in the early 90s. It used to be run by the Miami Valley FM Association. About five years ago, TAPR and the MVFMA started co-sponsoring the BASH and it took on its present form. The fact that I'm involved in both organizations had nothing to do with that :-). It's always been on Friday evening. The BASH was at NCR's conference for several years (the fact that I work at NCR had nothing to do with that, either :-)) but that facility was remodeled two years ago and the nice big dining room went away. Last year, and again this year, we're holding the BASH at Kohler's Presidential Banquet Center in Kettering.

As noted, the Banquet is always on Saturday evening. Sid Caesar, NH7C, started the APRS pizza party on Saturday night several years ago, and since he moved from the area, James K9APR has put that program together.

Enough Hamvention history for now... all I can say is, everyone here should attend the BASH on Friday, and the APRS pizza party on Saturday!!!

73,
John N8UR

You're welcome. I also did myself a favour and learned some geography of your fine country. I can almost dream up the provinces now and know where to place them, something I coudn't have done a week ago. My grandma's brother lives in Vancouver, so I took an extra look at that place. I also received a VE station via RF (somebody is feeding I-gate traffic back to RF...) and could check the map at that spot with findu and it matched okay!

I was puzzled by the Yukon province though, I made the map but wonder if there will ever be any APRS activity up there. Even if there is a DIGI, who shall receive it, it looks like a lonely place to me. Following the way up north I encountered some places marked "abandoned". The only place one can expect stations is in the south part of Yukon, near the Brittisch Columbia border. Hey, wait, the light comes on, you can of course use PCSAT from there!

Anyway, have fun with the maps!

Kind regards,

Henk.

P.S. Stan, Reply-All works fine on Eudora, thanks for fixing it!

Ever heard of the Alcan Rally? I participated as one of the communication guys in a sweep vehicle in 1990. That year we ran over 6000 miles in the ice and snow during the first two weeks of February, and went all the way up to Innuvik, Northwest Territories. We went through Yukon on the way.

I caught the rally more recently going into Arlington, WA, as I was on my out of that town on my normal commute. They were just getting started on that year's rally. I looked at my map and there were APRS stations amongst them, I think in the sweep vehicles.

Count on seeing APRS stations at least once a year up in the remote areas. I expect they'll try to run satellite ops once they get north of the populated areas.

There is a digi on the top of a tall building in downtown Brooklyn (its not true, there are no trees growing there!) but I'm fairly sure he doesn't Igate. As for the West Orange one, something must be there, I live in Randolph about 10 miles west and my packets make it to the net OK.

The NYC area isn't short of digi's but I don't know about Igates.

Tech spec:

TNC: PK88
TRX: MFJ Data Radio. 5W output
ANT: Homemade 300Ohm ribbon J-Pole taped to the computer room window looking East.
PC: P2/300 ruining (sic) Linux and Dale's APRSd.
Net: T1 all of its very own!

I don't know of any APRS co-ordination that goes on in the NYC area. One should "big it up" for N2ZRC whom tirelessly promotes APRS in the area but often gets nowhere (often not helped by me trying to pour a little common sense into things). Should we look to our local co-ordination body for this perhaps?

876. [aprssig] Waypoints with Garmin 12XL and TH-D7

From: "Mark Conner" <n9xtn@cox.net>
Date: Wed, 24 Apr 2002 19:32:19 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76297-2002.04.24-20.06.51--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I recently began using my D7 (non-G) and Garmin GPS-12XL together again. The D7 is sending waypoints to the GPS, but they're always displayed with the "comment" field rather than the "name". The name has the callsign, while the comment field just has the date/time of the packet.

Is there a way to default the display so that it displays the names as the default? Right now I have to change each waypoint as it comes in.

Mike and SIG,

Had a plain vanilla (or Lemon color, I guess) E-Trex. I put lithium AA cells in it. Then for various reasons I didn't use it for a while. When the batteries died, they took the E-Trex with it. It will power on, but if I go to a menu and try to change any setting, or if I let it receive and it gets the first satellite, it locks up and batteries must be pulled to power down. My guess is that whatever read-write memory in it is now read-only. Anything that would do a write to non-volatile locks it.

It was out of warranty. Anyone who's better with finding and replacing tiny parts than I am is welcome to it. I haven't taken the attic trash out yet. You're welcome to the serial (only, no power) cable and PFranc connector kits as well, but I gotta charge ya for them!

Found a GPS12 on closeout last year, so no biggie.

73,
Dale, W8ABZ

I thought Lithium cells were 3v???    Are they available in 1.5v?

I bought my son the E-Trex for Christmas.  The baseline yellow model.
Really neat!  I had a GPS-12 I was using and really liked his E-Trex.
I still got it, but since have also picked up a II+ and a III.  The 12 is
back
in the box.  It's still neat, but it has the 8v limit on input, or you can
toast it.  The II+ and the III will take a car input direct.  I've been
looking to unload the 12, but only because I have a couple of the things.
I think you'll be happy with it!

Mike

Dale,

You could try a reset, I once read about a similar problem that was solved
in the following way:

Pressing MENU, PAGE-UP and ENTER (all at the same time) you should power the
unit keeping the power button held for about 5 seconds. Then the unit
returns to it's original state.
WARNING! this will erase all waypoint and tracks on the GPS unit though I
don't think this will be a problem for you ;-)

Hope it works

I don't know how active APRS is in your neck of the woods, but here in southern California, there is never more than 5-10 seconds of dead air EVER on 144.39, even at 2:30AM. The rate at which data comes in from the TNC, and has to be processesed by APRSplus, coupled with the rapid-fire map redraws in Street Atlas every few seconds here would completely overwhelm a computer that slow!

Further, ham data modes (including the AX.25 packet that underlays APRS) increasingly are being operated with soundcard software modems (AGW packet engine or MixW) instead of a hardware TNC. The processing demands of these softmodems running along with SA and APRSplus are such that anything much less than a MMX200 just won't hack it. The savings on not having to buy a hardware TNC can be significant (have you priced a KPC3 lately.)

Again, as I mentioned in a previous post, I am not talking about the latest P4 screamers or 1.2 GHz Celeron machines being neccessary. I am running APRSplus, Street Atlas and a soundcard modem on a Dell 3000 P200 MMX laptop flooded with cheap (128MB RAM for $45) ram -- not exactly a state of the art machine but not a bottom-end "boat anchor" either.

Given the almost exponential decrease in the cost of ever-higher powered PC hardware, I feel it is a real disservice to newcomers to encourage them to start with dated underpowered hand-me-down hardware that will then immediately frustrate them when:
1) they can't run the same stuff "everyone else" is
and
2) they get nickle and dimed to death trying to upgrade obsolete machines to remotely approach current performance levels. For example, you pay more for 32MB of obsolete low-density 30-pin SIMM memory for an older machine than you do for 128 0r even 256 MB of current PC-100 DIMMs that fit in current machines.

When you can buy a complete 1GHz machine with a 10 or 20 GB drive and a modern UDMA CD-ROM drive that can read erasable CDs for $450 or 500, it doesn't take much upgrading to exceed this with far less results!

Subject: [aprssig] Re: Pizza or Banquet

Nope, even that clarification's not (quite) correct. McNasty's was an informal packet event that died out five or six years ago. It was never directly sponsored by TAPR, though there were very strong connections between TAPR and the folks who attended. McNasty's was (I'm pretty sure) on Friday night.

The BASH is one of the longest-running Hamvention activities -- it started as the FM BASH back in the 70s, and became the Packet BASH in the early 90s. It used to be run by the Miami Valley FM Association. About five years ago, TAPR and the MVFMA started co-sponsoring the BASH and it took on its present form. The fact that I'm involved in both organizations had nothing to do with that :-). It's always been on Friday evening. The BASH was at NCR's conference for several years (the fact that I work at NCR had nothing to do with that, either :-)) but that facility was remodeled two years ago and the nice big dining room went away. Last year, and again this year, we're holding the BASH at Kohler's Presidential Banquet Center in Kettering.

As noted, the Banquet is always on Saturday evening. Sid Caesar, NH7C, started the APRS pizza party on Saturday night several years ago, and since he moved from the area, James K9APR has put that program together.

Enough Hamvention history for now... all I can say is, everyone here should attend the BASH on Friday, and the APRS pizza party on Saturday!!!

73,
John N8UR

--On Wednesday, April 24, 2002 4:04 PM -0400 John Hansen <hansen@fredonia.edu> wrote:

> There's several things becoming confused here. What used to be at McNasty's was the "Bash". In recent years it was held at the NCR conference center and has apparently been moved to another banquet facility. It generally has somewhat more of the look and feel of a banquet than a casual get together. For example, there is generally a speaker. This event has always been held on Friday. I've not been able to attend it for the past few years, but I think you are correct, getting Bdale to speak is a significant draw.
>
> The Dayton Banquet is huge. It is directed at a more general audience. It is always on Saturday.
>
> The APRS get together is a much more informal thing. Folks show up order pizza and beer and talk. Generally there is an attempt to introduce everyone and let people make any kind of announcements they might like, but there's not much in the way of a formal presentation. It is also held on Saturday Night. As APRS becomes much more than simply a geographic location system, I think it would be great if folks who were interested more broadly in digital communications attended this. An argument could be fairly made that it is either outgrowing, or has outgrown the facility in which it was located last year. However, I really like the informal atmosphere, and the ability to just go order some food and drink rather than having a set meal.

Have you checked the File area of TAPR's site?  I live in Roanoke, Virginia
and I asked Mike to make me a Roanoke map and he did. (Been a BIG help
Mike, thankx!)  Also, there might be a map on the PocketAPRS CD that was in
circulation for a while.  Someone out there might have one.

887. [aprssig] New Canadian Pocket APRS maps!

```
From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Thu, 25 Apr 2002 20:41:05 +0200
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76475-2002.04.25-15.48.57--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain
```

Hello All,

[Resend to the APRS SIG, hopefully this time with carrage returns at line ends. I think I found Eudora's option to turn it on :-). Please report if it is still not okay]

For your information.

There are new PocketAPRS maps for Provinces of Canada which is also usable with APRS/CE, Xastir, MacAPRS 3.5.2 and WinAPRS 2.5.2 (Haven't seen this one released yet, Keith tested it a few months back) or better.

A Canadian ham asked me if I could convert the splendid APRS maps for the Canadian provinces by VE3ADJ and VE2AW. Both authors gave permission to publish the converted maps (and allowed me to convert even more, which I might do some day).

These are about the best maps I've made to date. Not only because my conversion tools finally handles labels and can insert dummy points in long vectors (allowing more accuracy), but also because of the very good source material of VE3ADJ and VE2AW. As with the Dutch map these maps use layering - showing more detail as you zoom in. So don't be disappointed when you look at the maps at 1x zoom, but zoom in and be amazed! Also the more you zoom in, the more labels show up on the screen.

Canadian maps:

File	Province	Source
marc.pdb	New Brunswick, Nova Scotia	VE3ADJ
pqhighw2.pdb	Quebec Highways	VE2AW
nontc.pdb	Northern Ontario	VE3ADJ
sontc5c.pdb	Southern Ontario	VE3ADJ
smb1.pdb	Southern Manitoba	VE3ADJ
ssk.pdb	Southern Saskatchewan	VE3ADJ
sab2.pdb	Southern Alberta	VE3ADJ
sbc2.pdb	Southern Brittish Columbia	VE3ADJ
yukon.pdb	Yukon Territory	VE3ADJ

Every time I work with pocketAPRS maps it surprises me over and over how efficient they are. All the information from the original map is present but the size is still low. All the provinces fit in a ZIP file of about 1 MB. So I hope the author of pocketAPRS will attract a lot new customers due to all these maps!

You can find the new maps, with other maps, on:
http://www.homepages.hetnet.nl/~pe1dnn/
(You may have to reload the map if you have a cached copy).

Kind regards,

Henk.

888. [aprssig] PocketAPRS maps

From: "WL7FT" <wl7ft@mmcable.com>
Date: Thu, 25 Apr 2002 17:23:31 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76494-2002.04.25-17.53.31--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I see a lot of talk about "Pocket APRS" I relish the idea of being able to run an APRS station on my Palm/Visor PDA. What I would like to know is will the Visor Springboard GPS unit NMEA data flow out of the cradle connection? Can I get the Visor with the Springboard GPS to transfer NMEA data from the internal GPS unit to the cradle connection at the bottoom of the Visor to connect it to a Tiny trak or like TMC? or use it to plug into a laptop and use it as a standard GPS unit with an output?

I have asked politley to the Magellan people who tell me its the software gods, I have asked the Handspring people who tell me it is the GPS people, and I can never seam to fing the PocketAPRS people to ask them!

Can anyone help me?

```
I'd like to use the PDA as it's display is much bigger, and I see a mapping
GPS as duplicative.

HELP!

Mark

```
I use the same setup, and my waypoints come in as the callsigns.  How are
you set up?  Do have 6 digit NMEA enabled?  Mine worked with default
settings on both the GPS and the radio.

Mark,

  If you haven't already, check the Pocket APRS site at :

http://www.pocketaprs.com/

There's also an e-mail link to Mike Musick, the software author.  I've
found him to be very helpful about answering questions.

Good luck and 73

Mike is currently working on the routines in PAPRS to support the Shine
Micro TNC. I think hes planning on making all packet/APRS data come out of
the spring board port and let the com port take in GPS data. This is what
PocketAPRS users have been waiting for. Now we can have a TNC and GPS
connected at the same time without having to use a data switch of some
sort. Mike is great for answering questions, he even made up that custom
map for me when I asked. I plan on picking up a springboard TNC at
Dayton.

Ummm, isn't this going to lead to problems if you're transmitting blind on
a frequency? If more than one wide digi does this you'll just have
collisions. (I know some collisions are good in APRS, but they don't seem
reasonable in this case.)

If you really need to limit the overlap of wides in this area (and it
doesn't sound like you do) turning the thing into a listen only igate seems
like a more reasonable solution than blindly transmitting on another frequency.

Bill

Rendered body type: text/plain

Hi All,

On Sunday April 28th, there will be the Annual "Peaks to Parrie" Race.
This race starts at about 8 miles south of Red Lodge MT.
It starts with 10 mile run, then 45 mile Bike Ride, and finishes with 15
mile Cano or Kyak ride.
We will have a few APRS Units operating to help with this race.
The Race starts at 8:00 AM and normally finishes by 5:00 PM MDT.

As this is a first time use in this area, we hope to learn alot.

894. [aprssig] Icons and findU

From: Steve Dimse <k4hg@tapr.org>
Date: Fri, 26 Apr 2002 04:58:06 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76562-2002.04.26-04.32.33--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There is a long way to go, but so many people have asked for this over the years, I thought some of you might like to see this before it is ready:

http://www.findu.com/cgi-bin/dmap.cgi

I have moved the entire www.aprs.net map directory over to the server, including all contributed maps, you can play with one simply by adding a map= parameter, so the south Florida map is:

http://www.findu.com/cgi-bin/dmap.cgi?map=flsouth.mp

No list yet, but I'll have one eventually. You should not make links to this, there are several things I'm working on that will change the way a link should be saved. Also, there was a problem with the way I had been saving icons, so up until yesterday when I fixed it, most stations appeared as WX stations, so if you use a long last= param, don't be surprised to see lots of these!

Once I am happy with icon drawing, I'll be adding this capability to other cgi's like plot and track.

-----A POLL-----

Drawing without icons has been around so long, I'm wondering if people will want the icons without asking for them. The option for either will be available, but which should be the default, with or without icons? Email directly to me please (and thanks Stan for making this easy again!), and I'll take split votes if you want (for example icons on plot and track, no icons on radar-find so as to hide less of the radar).

-----A REQUEST FOR HELP-----

I'm using the same icon files I made for javAPRS in 1996, taken (with permission) from the MacAPRS icons of that era. A lot has changed since then, I'd like someone to take these files and update them. Basically there are 5 image files, one for the primary and alternate symbol tables for maps of white and black backgrounds, and last for overlays. They are laid out as 16 down x 6 across grid of 16x16 pixel icons on a transparent background...I just copy the portion of the image corresponding to the icon I need...a lot easier than having a couple hundred files! You can get these in any javAPRS distribution, or from my server:

http://www.aprs.net/javAPRS/allicons.gif
http://www.aprs.net/javAPRS/allicon2.gif
http://www.aprs.net/javAPRS/blkicons.gif
http://www.aprs.net/javAPRS/blkicon2.gif
http://www.aprs.net/javAPRS/overlay.gif

Rendered body type: text/plain

Hi Steve,

I have done some updates to the icon files. If someone wants to make further changes, download japrs.jar from http://www.ae5pl.net/javaDocs/javaprsdnld.htm and unzip the .gif files. Please use these as your basis so we don't have two development efforts going on.

Thanks.

73,

Pete Loveall AE5PL

>
> I'm using the same icon files I made for javAPRS in 1996, taken (with permission) from the MacAPRS icons of that era. A lot has changed since then, I'd like someone to take these files and update them. Basically there are 5 image files, one for the primary and alternate symbol tables for maps of white and black backgrounds, and last for overlays. They are laid out as 16 down x 6 across grid of 16x16 pixel icons on a transparent background...I just copy the portion of the image corresponding to the icon I need...a lot easier than having a couple hundred files! You can get these in any javAPRS distribution, or from my server:

THis opens up one of my "APRS standardization" issues that prevents us all from speaking a common language. That is zooms and range scales. APRS was designed with the concept of Range Scale. Thus unambiguously, anyone can refer to a map Range scale and everyone else will all know what he can see. I dont like X-Zooms. THey are completely ambiguous, and convey no absolute meaning.

I was very surprised when I saw PocketAPRS doing this. Is there anyway to change this to a Range Scale? If you are on a 64 mile "range Scale" that means that everything within 64 miles of the center is visible. If you zoom to the 8 mile range scale, then anyone else that is on an "8 mile range scale" (no matter what version of APRS he is running) he will see the same thing. It is only one line of code to convert from an arbitrary "zoom factor" to a meaningful "range scale". And APRS would be so much the better for it...

> collisions.

No problem for several reasons...

1) In general, individual mobile users will not be listining on that freq.
2) The only reason for this output is for Igates or people who want to see
   the big multi-state wide big picture... (mobiles overload on such data)
3) Because these are very tall and widely separated.  Any user on the
ground will only hear one of them, or even if he does hear  both, one will
certainly be 10 dB stronger and capture.

> If you really need to limit the overlap of wides in this area (and it

Yes, that is exactly the idea.  The IGATE (located anywhere on the
ground) listens to the non-144.39 output.  and its as if it was on top of
the big mountain...

Rendered body type: text/plain

Another option {if the site is suitable} would be to convert to a Digi_Ned computer based system. This would allow for the creation of a unique set of rules that could minimize problems. It should be possible to limit output from the site to only a desired path and through rule creation avoid dupes from other local wides.

The local NA4V-2 digi that I helped set up has undergone several rule modifications and is now working very well. Over the summer I hope to further simplify and refine the rules.

I will, at some, point document all of this but my Constitutional Law pre-final is only three hours away so it will have to wait. Pass this and I can skip the much tougher final.

> will want the icons without asking for them....

Neat stuff!
My only comment is that I think most big maps look much better if only
ICONS (and no callsigns) are displayed at map range scales greater than
256 miles.

1) No one can distinguish individual calls anyway at such large map scales
2) Even if you do see a call, you still have to zoom in to make sense of it
3) You have to zoom in anyway, to resolve where the individual calls go..
4) Even if there is an ICON out in the middle of the atlantic, then
   he is still very visible and a simple zoom in, will reveal his call.

BIG maps (of the full feed) are only useful to get the big-picture of
activity, they are not very valuable to see individual calls. Yet if the
automatic suppression of calls above 256 mile range scale is used, then
the big maps with all the icons are very pleasant and revealing to look
at.

APRSdos has always done it that way when looking at large map scales with
one exception. Any Satellite callsign is always shown, since they cover
very large areas in short amounts of time. The rule for detecting a
Satellite call is that the ICON will be one of these three combinations:

```
   /S  Shuttle
   \S  Satellite
   S#  Digipeater with "S" overlay
```

Just a thought...

Rendered body type: text/plain

Is there any way to have APRS+ SA restore the settings in the TNC when it
exits? It is setting my beacon to 0 and changes the UNPROTO path and
BTEXT. I have to remember to use Hyperterm to restore the default settings
each time I close APRS+. I know APRS dos does it correctly.

Even better would be a way to designate different files to use depending on
whether the TNC will be a home relay, a digi, or perhaps a stand alone
tracker.

This is basic functionality that should be available in all of the APRS
packages.

Rendered body type: text/plain

I have a Palm IIIc and have made up cables for my laptop to my
Garmin GPS units before. But not for the Palm.

Now, I suppose I could use my hotsync cradle, since it has a power
input to charge the Palm, but I was thinking I could make up a small
box to feed power to the GPSIII I have as well as to the Palm.

Anyone know of a Palm interface cable that has power on it? Palm
to anything, actually... The key is to have the power feed so I can
charge the Palm. (I know the hotsync cradle has a regulated 5v
feed, so I'm assuming that's what I'd need.)

>
> Found a GPS12 on closeout last year, so no biggie.
>
> 73,
> Dale, W8ABZ

As far as I know, the GPS12 is still a current model from Garmin. The
12CX was discontinued. However, with the introduction of the E-Trex,
it appears that the market for the 12 has been seriously eroded. A lot
of retailers are cutting back on carrying the 12 and instead carry the
E-Trex as the 'bottom line' unit. Hey, the little E-Trex is a fantastic
unit
for the money! I bought my son one for Christmas and I had a 12.

Anyway, the going price for a new 12 on the shelf seems to be about
$140 or so, except from vendors that are dropping that unit to carry it.

You may have gotten a deal on the fact the dealer just wanted to drop
it from his inventory, not that it's discontinued. (Although personally,
I
wouldn't be surprised if Garmin drops the 12 in the future. I don't see
how it can maintain a slot in the face of the E-Trex. Although it is a
great unit, it does have a few drawbacks. The internal antenna for one.
And the 8v input for another. (Although the E-Trex is 3v input.)

Just sending an update. I have recieved the latest mail from the DCARC president. I have roughly a dozen more names to add and will update the amounts this weekend. Tuesday is the cutoff date. The plan is to contact Dell on May 6th to see what we can arrange using the DCARC 501c3 status. The DCARC will also send out the letters for the donations that requested it for tax deduction purposes in May. Most of the cheks should have cleared by now. If you made a donation in mid March, those are the ones we will be processing this weekend. If you made a donation before the middle of March and it has not cleared yet. Please contact me of the lists and we will see what the status is.

There is a long way to go, but so many people have asked for this over the years, I thought some of you might like to see this before it is ready:

http://www.findu.com/cgi-bin/dmap.cgi

I have moved the entire www.aprs.net map directory over to the server, including all contributed maps, you can play with one simply by adding a map= parameter, so the south Florida map is:

Rendered body type: text/plain

There are two APRS forums at the Dayton Hamvention this year: an hour-long forum moderated by WA1LOU and a half-forum moderated by K4HG (which is really part of the TAPR Digital/Packet forum). In order to get more bang for our buck, K4HG and WA1LOU have joined forces to present the floating APRS forum at Dayton this year. Instead of having the same speakers speaking at both forums, each part of the floating forum will have a unique list of speakers.

Part 1 of the forum is on Friday, 9:30-10:30 AM in Room 3. The speakers at Part 1 will be Bob Bruninga, WB4APR, Dale Huguley, KG5QD, Mike Musick, N0QBF, and Keith and/or Mark Sproul, WU2Z and/or KB2ICI.

Part 2 of the forum is on Friday, 11:30 AM 12:00 PM in Room 1. The speakers at Part 2 will be Steve Dimse, K4HG, and Michael Cai, KF6ZDM.

For updates about the floating forum and everything else going on at Dayton APRS-wise, check the 2002: APRS Dayton Odyssey Web page (http://www.tapr.org/~wa1lou/2002/2002.html).

Hi John

In the main APRS+ directory is a file called RESTORE.TNC and you can edit it to include any commands you want to have sent to the TNC when you close the program. This is the same as is done in APRS-DOS.

Likewise the TNC configuration file that you select when you start APRS+ can be modified to include anything you want in addition to the normal configuration commands required.

I use the KPC tracker in my car as a standalone and at other times run from the laptop. My APRS+ 'KPC.TNC' file includes the lines to set all of the BLT's to zero. Thus my transmissions when I use the 'laptop in the car' configuration are from the APRS+ program. Likewise my RESTORE.TNC file resets all of the BLT's to my timed beacons so the KPC will beacon without the computer. It's the same steps you are doing using hyperterm.

It works great.

> This is basic functionality that should be available in all of the
> APRS packages.

APRS+, APRS (DOS) and WinAPRS all have the restore.tnc configurations.

```

```
Check these guys out at: http://www.syncablesolutions.com/

If I remember right the Palm IIIc uses the same connector as the othe Palm
III units.  I would just buy one of these since the Palm brand cable is
discontinued now, chop off the DB-9 then feed it power and data that way.
7805's are small, you can probaly fit it inside the DB-9's shell.  I use
```

Handspring Palms mainly, so I had a few more obsticles, but it was nothing
a MAX-203 could'nt fix. Hope that helps.

Ummm... Where is the MAX-??? (or equivalent) chip? inside the DE-9
housing? Careful what you chop off!

The Palms/Visors use 3V serial in/out. You need a converter
somewhere along the line to bump it up/down to more acceptable
RS-232 levels. Somewhere inside that cable is a converter chip.
Just be sure which end it's in before you get out your wirecutters.

Another place for cables is markspace.com

Has anything been planned possibly to make these a live web broadcast ? With
the advent of 802.11b and broadband these past 2 years I would suppose this
is a possibility.

Subject: [aprssig] The Floating APRS Forum at Dayton

There are two APRS forums at the Dayton Hamvention this year: an hour-long
forum moderated by WA1LOU and a half-forum moderated by K4HG (which is
really part of the TAPR Digital/Packet forum). In order to get more bang for
our buck, K4HG and WA1LOU have joined forces to present the floating APRS
forum at Dayton this year. Instead of having the same speakers speaking at
both forums, each part of the floating forum will have a unique list of
speakers.

Part 1 of the forum is on Friday, 9:30-10:30 AM in Room 3. The speakers at Part 1 will be Bob Bruninga, WB4APR, Dale Huguley, KG5QD, Mike Musick, N0QBF, and Keith and/or Mark Sproul, WU2Z and/or KB2ICI.

Part 2 of the forum is on Friday, 11:30 AM 12:00 PM in Room 1. The speakers at Part 2 will be Steve Dimse, K4HG, and Michael Cai, KF6ZDM.

For updates about the floating forum and everything else going on at Dayton APRS-wise, check the 2002: APRS Dayton Odyssey Web page (http://www.tapr.org/~wa1lou/2002/2002.html).

Uh, no, I mentioned the MAX for my cable. He has a PALM IIIc, he can use the regular serial cable without any level conversion. The Handsprings output TTL and require TTL in that is why I used a MAX-203. The Palm brand PDAs use true serial on the ports. That is why he can take a typical Palm serial cable and chop off the DB-9 and put on what he needs including power to the coresponding pin.

Umm.. No.

3V is the minimum 232 spec. My IIIc outputs standard 232.

I've wired up a cable that plugs into my laptop's USB connector (5V) and charges the palm, and also provides connectivity to my TH-D7 for portable work. No converters needed.

True, 3V is in the spec. Inverted serial is not...

For a Handspring you still need to invert it, and there's probably not much protection at the Handspring interface either. You still need the converter chip (or equivalent) for a Handspring.

It sounds like for a Palm they have the normal polarity of serial signals going in/out. That's a good thing.

Sounds like the handspring presents the UART TTL pins on the interface.
That's definitely not 232, though it's still async serial.
You have to add a level converter in both directions to make that happen.

Curt, did you actually read a damn thing I said on this subject? I said ALL along that the Palm III units use standard 232. The HANDSPRING is what need the level conversion! I NEVER said that the Palm III units needed the chip, YOU said that. Even Dave backed up what I said. I'm not an engineer, but I do know how to read and learn without getting a college degree.

I actually designed and built my own cable for my Handspring units. You can see a schematic on my site at www.ke4nyv.com/portapacket, can link to it from there or go directly with this link http://www.ke4nyv.com/ttltoserialcable.htm. There are also pictures in the Portable Packet section.

Take a chill pill, I'm just trying to help man... In between doing a bunch of other things that I'm paid to do.

I don't believe that I cut anyone down with what I said or tried to invalidate anyone's points... Just trying to add to the conversation and fill in holes here and there. I own a Handspring Visor, not a Palm, so I'm no expert in Palms. Never claimed to be. I just said to be careful. Other people filled in the rest of the holes.

If I didn't understand the conversation as a whole and interjected things that didn't need to be interjected, blame it on the 10 different projects that I'm working on today.

'nuff said.

Rendered body type: text/plain

I have my mobile as WB8NUT-12 but am trying to change the symbol to the blue RV vehicle. Since I have a KPC3+, the symbol must be changed using BTEXT. I have changed BTEXT to ">{R} Duffy - www.wb8nut.com". After the TNC sends the beacon text, the symbol remains a Jeep on WinAPRS 2.5.1. Any suggestions or am I formatting the BTEXT incorrectly.

I know, kind of stupid, but it's raining here today. Have to find something to play with on APRS.

Duffy

aprsd controls what stations are gated to RF in the aprsd.conf file -
near the end. Comments in the config file itself.

Here's an example:

```
Gate2rf IGUP KC7ZRU-3 RIWTOR
```

IGUP - the 'I-gate is alive' beacon from N7XUC
KC7ZRU-3 - my mobile tracker
RIWTOR - Tornado warning issued by NWS from the Riverton, WY office

All 3 of those will be gated to RF as soon as they're seen on the I-net
side.

Be sure to understand the difference between 'Posit2rf', 'gate2rf' and
'Msgdest2rf' - it's all explained in the docs and in the config file's
comments.

```
Can anybody tell me the specific settings to use to connect to a KPC3+ using
Hyperterm?  I have a 3+ that has been programmed with the settings (by
another ham) to act as a digi for my area.  We are finally ready to put a
digi on the air in the near future, but the location, antenna height, etc.,
has changed since the tnc was programmed.  I've tried to connect to the tnc
using Hyperterm, but can't get any response.  Obviously I'm doing something
wrong, but I don't know what.  I need a step-by-step procedure, settings,
etc., for doing this.

935. [aprssig] Reminder for D700 owners (NWS watches/warnings/etc)

From: "Mark A.Foley" <na4v@cox.net>
Date: Sun, 28 Apr 2002 08:59:47 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76911-2002.04.28-08.34.59--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
D700 Owners....
If your local Igate is gating NWS watches/warnings/etc to RF, you may
want to add something to your D700 programming if you want to receive
the accompanied text message(s) that typically follows when a NWS
warning is issued and gated to RF.  These text messages describe the
storm/event...its movement...speed...etc....

To receive the text messages, you will need to add SKY* to your message
group code.  To do this:
        1. Press MNU to enter Menu mode
        2. Select MSG GROUP 3-P
        3. after the ALL,QST,CQ,KWD, add SKY*
        (see page 34 of your Kenwood Specialized Communications manual
for more information)

With recent changes to how Dale's WXSVR is sending these messages,
owners who are not interested in NWS/SKYWARN stuff (I can't imagine who?
<g>) will not receive the messages and fill up their message buffer

Mark A. Foley, NA4V

```
I'm going to start using a TH-D7ag when I'm on foot away from my truck, and
I'd like to set up my mobile tracker in the truck to digi the low power
packet from the HT. My tracker is a KPC-3+ (v. 8.3) and a 50W mobile rig.
In order to set up the tnc so that it only digi's my packet from the HT and
not everything it hears (want to keep from flooding everybody), what do I
need to do? Do I use the uidigi command and just enter the call with ssid
from my HT? ANy help would be greatly appreciated.

Dear Mark,
By now, you may have already received a ton of e.mails with helpful advice
(or possibly not...it's tough to know with the way the sig is configured for
responses now).  [[Stan...not a flame...just a truism]]

There are three reasons for the symptom that you are experiencing:
```

o Your connection between computer and TNC is faulty
o Your baud-rate (between computer and TNC) is set incorrectly
o Your TNC is in a non-interrogative mode (one that doesn't allow
  communication with a TNC)

o Your connection between computer and TNC is faulty

This is a physical thing. Check for broken wire, etc. Also...to communicate with a TNC, your cable must have three good wires...and they must be TX, RX and signal ground. The TX on one end of the cable must connect to the RX on the other end. The signal ground is 'straight through'.

o Your baud-rate (between computer and TNC) is set incorrectly

Don't confuse the TNC's 1200 baud rate (how fast it TX's over the air) with the speed with which it communicates with your computer. They are two different things. Try 9600 baud first, then 4800 baud, then 2400 baud, then 1200 baud, in that order. NOTE: some combinations of OS/hardware may require that you set the baud rate in HyperTerm, then exit and return to HyperTerm before the changes take effect.

o Your TNC is in a non-interrogative mode (one that doesn't allow
  communication with a TNC)

This is most often the case when a KPC3 (and +) is used in a mobile tracker. In that case, the last command that is issued (to put it in that mode) is INTFACE GPS...which silences the TNC to Computer interaction. To 'awaken' it again, one issues <ctrl>-<c> three times (at the baud rate specified in it's configuration [see bullet above]) after which you are presented with the warm and friendly CMD: prompt. :o)

Note: for some reason, HyperTerminal intercepts <ctrl>-<c>'s. While some people have had success in using it for such purposes, I've had more problems than it's worth...and have reverted to using a Legacy Serial Communication software system that was built in the DOS days. This system has *never* failed me. If you want to give it a try, you can find it here:

http://classic.tucows.com/preview/4682.html

Here's wishing you well. Let us know when you're successful so we know when to stop answering your inquiry. :o)

Warm regards,
Ev Tupis, W2EV

Tim you can adjust your serial port settings in Hyperterm to match the baud rate of the TNC. Once you have Hyperterm up, select File, Properties and look at the "connect to" box. It should show your serial port. Then select Configure. That will allow you to check your baud rate to the serial port. Start with 9600 and work down.

Another way to configure is when you are in Hyperterm, power the TNC down, then back up. You will see garbage. When you start to see text, press the asterisk key (Shift 8) and that will match the baud rate of your KPC3 to Hypertems baud rate.

```
        I use this (Hyperterm) all the time to configure my KPC3's.

Rendered body type: text/plain

As nobody could give me a reason to either close it or keep it open, I have decided to close it. My reasons for this are simple; I can't be bothered with it.

I am however willing to turn the running of it over to someone else (whom would probably do a better job than me anyhow). If you'd like to take over the running of the Igate drop me a line.

Mark, try out 9600, N81 in the settings. Then turn on the KPC3+ and see what kind of text you get. If it is garbage, tell hyperterm to disconnect, then try 1200 baud and step your way up. You have to disconnect hyperterm (not close) before you make changes or it will not take effect. Once you get a command prompt, I suggest you send the echo on command.

Bud, do not install any generic aliases in the tnc, tell your D7AG to digi via the specific call in your KPC3+. If you do not have generic aliases (WIDE, WIDEN-N etc) your digi in the KPC3+ will only digi stations that point to your call in the KPC3+. Tell your D7A to digi KB9WVG-3,WIDE2-2. Use what ever ssid you want, I picked -3 out of habit. No one else should have your digipeater call in thier unprotopath. This will keep you from being the roaming "RELAY" for everone else.

If you use aprsd 2.1.4.vk3sb2, the cvs distrobutions and up, you can wild card the last 3 characters. For example, RIW*. That is what I am doing in the DFW area.

```
Has anyone on the sig hooked a GPS to the above radio, if so
how did you do this. I have had this rig for several years but
never even opened the box. Looks like a great radio for APRS.
All you have to do to hookup a KPC3 is to plug it into the radio.

```
Ev,
At the bottom of your suggestions, INTFACE may need to be set to TERMINAL
instead of NEWUSER or whatever its set to.  That may clear up the
communications between TNC and computer.  I have used HYPERTERMINAL for a
while with TNCs and haven't had a problem.

947. [aprssig] ISS and PCsat SATgates

From: Bob Bruninga <bruninga@usna.edu>
Date: Sun, 28 Apr 2002 12:46:01 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@amsat.org, TAPR APRS SIG <aprssig@lists.tapr.org>
Message-ID: <LYR842-76945-2002.04.28-12.21.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Someone wrote about simple OMNI Satgates for ISS and PCsat:

> a plain 5/8 whip works for me, as does crossed dipoles over a large
> ground plane. [My almost flat aluminium roof]. I have a VK5 preamp which
> works wonders too.

SATgate antennas for ISS and PCsat feeds to the worldwide internet are a different kettle-of-fish from our normal terrestrial ham experiences:

1) The SATgate does not need to hear all packets. Even if it only hears 70%, then two SATgates in the same area combined will hear 90%.

2) Below about 10 degrees, these birds are too far away to be reliably decoded on any OMNI antenna. Putting OMNI gain on the horizon is really a wasted effort since that gain will subtract from gain at higher angles and it will never be enough on the horizon anyway.

3) OMNI SATgate gain should shoot for angles above 10 degrees. Use a 1/4 wave whip over a ground plane. This antenna has a broad lobe that will hear the satellite the other 70% of the time when it is above 10 degrees and the satellite is 6 dB or more closer.

4) The 5/8th wave has all of its gain on the horizon. At all angles above 15 degrees, the 1/4 wave does several dB better AND the bird is 6 dB or more closer. Between 30 to 50 degrees, for example the 1/4 wave is 11 dB or more better!

So put the gain up, where you can hear it and dont waste gain down where the signal is too weak anyway... See these two WEB pages:

* 70% of the time the Bird is above 10 deg. See table in:
      http://www.ew.usna.edu/~bruninga/rotator1.html

* Gain of 5/8ths versus 1/4, see plot near the end of:
      http://www.ew.usna.edu/~bruninga/astars.html

The plot was done for 435 MHz to hear the mode J birds, but it also applies for 2 meters. Ignore the plot labeled 2m 5/8ths because again, that was showing the received plot using that antenna at 435...

What you want to compare is the 70cm 1/4 and 70cm 5/8ths plots to see the improvement at all angles above 15 degrees. Yes, the 5/8ths does have an some better performnce above 60 degrees, but any satellite is only above 60 degrees less than 2% of the time!

Nothing beats a 1/4 wave whip over a flat ground plane for simplicity for ISS and PCsat type SATgates... (other than an AZ/EL tracking system of course). The simplicity, redundancy, reliability of having 2 or more simple OMNI satgates is usually going to be better than trying to maintain a single vulnerable hi-tech az/el tracking satgate...

And the 1/4 wave will do 5 to 10 dB better than a 5/8ths... during the majority of the time it can hear it.

948. [aprssig] HAMvention maps

From: Bob Bruninga <bruninga@usna.edu>
Date: Sun, 28 Apr 2002 14:09:48 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-76947-2002.04.28-13.44.19--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anyone hve a copy of the HAMVENTION brochure for this year? Is it published yet? I cant find it on the WEB.

I want to see if the maps of the surrounding area that show where the hotels are has some kind of legend that happens to "number" both hotels and restaurants and other specific venues..

If I get APRStt working by then, then anyone with an HT can enter just a few TTone digits such as B2*n*D on their HT using Touch tones and APRStt will put out a position packet for them showing them at the location of hotel number "n", or restaurant number x.

APRStt is ideal for this kind of venue with known places. It is also perfect for special events and races and all manner of places where you want to let people move themselves around on the map with nothing but a TTone HT.. and no GPS. And it works indoors too.

In the example above "2" is the "table" of hotels, and "n" is the nth hotel in the list. APRStt will convert that to LAT/LONG.. such as

Table 0 will have the 10 buildings at HARA
table 1 will point to 10 areas in the flea market
Table 2 will be major motel areas
Table 3 will be major restaurants or locations of ad-hoc meetings
etc...

Hopefully these numbers can be derived from the brochure so that everyone will have access to the same information!

See http://www.ew.usna.edu/~bruninga/aprstt.html

Rendered body type: text/plain

Can some one tell me the differences between the Source Forge version of
aprsd (2.1.4) and WA4DSY's (2.1.5).

Is there some reason the 2.1.5 version is not in the Source Forge CVS ?

I'm just a little confused as to where I should be going to stay up to date.

Thanks.

-Neil

They are Severe Thunder Storm reports from the National Weather Service.

They will hang around untill Steve Archives them.

```
Greeings,

Release 1.12.1 of TNOSaprs is now available if anyone wants to play.

Couple of new features ...

1) URL locator for any callsign displayed on the '14501' page.

2) Sysop can disable DTI tracking on the APRS heard table.

For update kits, documentation, and other stuff, visit this URL below :

   http://www.qsl.net/ve4klm/packet/aprss.html

Best regards,

Maiko Langelaar / VE4KLM

Actually, the sourceforge version is currently 2.2.3, not 2.1.4.

2.2.x is just the evolution from 2.1.4. I think most of the 2.1.5 changes
are in 2.2.x already too, maybe some are missing.

In summary: use the CVS code from sourceforge.

To add to what Hamish has already said,

The RELEASE version 2.1.4 is available on the sourceforge site as a tar ball. I think it is parallel to the 2.1.4.vk3sb.2 release - but I don't know for sure.

The 2.1.4 tarball on sourceforge does NOT include the latest updates, changes and features of the CVS version.

In most projects, the CVS version is considered the 'development' version - subject to the occasional unexpected feature (bug). The release version is considered more 'stable' and more 'bug free'. Normally it's recommended that "production" work not be done with a development version and only the 'brave at heart' use the devel version since it is more likely to contain bugs. Those are 'generic' ideas that may well not apply to the unique development track of aprsd to this point though!

Maybe it's time to take a snapshot of the CVS version, tarball it and 'release' an updated version on the aprsd page of sourceforge.

Just a SWAG, but along with a 'new release' announcement, I'd bet we'd see a flood of servers updated. Could well be a very good thing on many fronts.

Best advice I could start with is a friendly RTFM <g>

Find it at: http://www.kantronics.com/downloads.htm

They include a very good, detailed list of what to do from the hardware level upto and including the application level. As you'll find, it very well may be that your TNC there has been altered from the defaults - so there's no way for any of us to 'guesstimate' at what it's current settings are. You'll likely have to go through all of 'em systematically. You *may* get lucky, after verifying the serial cable (hardware level) is correct, with a 9600,8,N,1 - one of the more "common" parameter sets. As usual, YMMV

If after going all the permutations and if it *still* doesn't work - holler back with more specific details of what's not working, what you do see, etc.

Of course, you could always just perform a hard reset, blank everything back to factory default and start over. If so, you can find good suggested settings at the questionable web page:
http://www.dididahdahdidit.com/

Good luck!

JD,

That's almost like asking for 'how-to' instructions for operating a
radio. The answer is, it depends.

What are you going to use to I-gate with?

xastir
aprsd
UI-View
APRSA+
WinAPRS

And I'm sure there are several more I've left off that list.

Be a bit more specific on what you're going to use and you'll get much
more detailed info!

I've played with this as well as another open source mapping application, GPS. Both of these work nicely, but there are two major problems. First, while the programs are readily available, the data is not. There are some US sources of street level data which can be used, but the rest of the world has no such data available.

The second problem is processing power. With just coarse water body outlines, GPS takes 4 seconds to draw a map, add DLG data and it takes 17 seconds. This is on the present findU machine 1.26 GHz dual PIII, it just uses one processor, but it means that you would need more than two of these machines just to meet the needs of just the find page, and to produce DLG maps (which are far lower quality than the MapBlast maps). Who would want to wait 17 seconds for a map to load anyway?

I don't consider rolling my own maps with eith of these applications viable for findU. One or both of these may be good for generating some maps for local use, e.g. an interface with Xastir. Creating a data set is no easy task though.

For APRS+SA users:

With APRS+SA, go to the SETUP -> LISTS and enter callsign for the station information you want to gate. In my case I use BMX* to get the messages sent to SKYBMX since the sending callsign always starts with BMXxxx for messages generated for the Birmingham, Alabama area. We also gate the OHX* messages from Nashville , TN since we are in between the two areas and have coverage extending in both directions.

This allows you to gate weather information for your specific area versus all SKYxxx messages.

73's,

Tim - N8DEU
Huntsville, Alabama

I've found many sources of Shapefile maps, but as you say maps for
the U.S. are more readily available. I'm using TIGER/Line 2000 map
data already pre-converted to Shapefile format that I found on the
'net. They're free and nicely detailed. I've also found country
boundary Shapefiles on the 'net.

> I don't consider rolling my own maps with eith of these applications

> is no easy task though.

No need to generate maps for local use with Xastir via Mapserver!
Well, not unless they're in DLG format which Xastir can't handle
yet. Xastir can directly use most of the libraries mentioned above
(and others) to generate maps directly from the base data. It can
also use raster images, but why go there when vector data is so much
more useful?

Our Shapefile stuff, when used on Shapefiles that were generated from
TIGER/Line 2000 base data, is similar to what the TigerMap server
generates (latest CVS version of Xastir, new stuff added saturday).
We now have nice street-level maps for Xastir while mobile.

Speed doesn't seem to be a problem. It's in the neighborhood of 4
seconds to generate a map view from detailed county shapefiles on a
PII-300 machine. It'll perform much better on any recent machine.

A big thanks to the people who wrote the above libraries and other
libraries that Xastir uses. Without those libraries we'd still be
limited to a very small number of map formats.

Wish to try the Shapefile support in Xastir? Be sure to use the
latest CVS version of Xastir. There have been a lot of code changes

lately, but then again, when can I _not_ say that?

Two questions on PCSAT:

1) What *is* the uplink/downlink frequency? Some doc
that I've found states that it's 145.827 MHz, other
doc specifies it at 145.825 MHz. Which one is
accurate?

2) I'm planning a run through upper Ontario over May
25/26 and will need to use PCSAT or ISS to track me.
How can I find out what times of day it will be
"visible" to me?

Thanks in advance for any info....

Its about 145.828 so works best on .830 first half of pass and then
145.827 later in the pass.

Rendered body type: text/plain

```
Here is an example of the value of vicinity tracking.

My wife headed for grammas house and I turned on the D700 in her car, but
apparently forgot to enable the GPS.  So although her car reports in our
driveway, I have been able to follow her across two states just by
looking at the 1st digi in the path on FINDU.

Now that the first digi in her path is the local digi in Gramma's town, I
know she has probably arrived there...

The path she is using is via RELAY,WIDE,TRACE

For just general tracking for long distance travels, this technique
requires no GPS and with just a timer powered TNC, you could make a
battery  powered device that would send out a packet once every 10 minutes
that would fit in a cigarette pack and last a month on AA cells... and
track it anywhere in the "aprs" world...

```
Thanks to all those that replied on and off the list with suggestions.  For
future reference, the key parameters are:  Direct Connect to Com (X); 4800;
8-N-1; Xon/Xoff.  The last was my problem, it seems that HyperTerminal
defaults to Hardware flow control.  Once I get the correct lat/long and PHG
settings programmed in, there will be a new digi in north-central Oklahoma,
STLWTR, or K5SRC-1.  Hopefully this will be in the next two to four weeks.
It will have a 10 watt Motorola to a 6db gain antenna at 310', which should
fill in the current gaping hole in north-central Oklahoma, giving APRS
coverage almost all the way up I-35 to the Kansas border.

Thanks again to all & 73,

If you talking about the MapShots data. It was directly converted from Tiger
Line 1997 files to ShapeFile format (2000 files coming). However, MapShot's
primary business is Agricultural GIS, so the data sets I looked at where fine
in the country, but Metropolitan (Try Cedar Rapids, IA in Linn County) areas
where empty of street data.

Just a follow up to last year's request. Has any progress been made in the
shelter component or spec's of the APRS working group. That is, will the
next release of winaprs build in shelter reporting?

Looks to me the shelter component can only become more important as we work
through post 9/11 issues.

Well, I haven't. But, I have connected various serial devices to my
Macintosh machines.

> The mac is an older model LC with 2 8 pin mini din serials.

Is the D700 RS-232? I can't seem to find any serial port info nor a
pinout in the D700 manual. Anyway, most of the Mac serial ports can
emulate RS-232. And, I believe the LC supports it.

```
Mac 8-pin (RS-232 mode)
---------
 1 - RTS
 2 - CTS
 3 - TXD
 5 - RXD
 4 - GND
 8 - GND
```

Connecting pin 8 to pin 4 is what triggers it to emulate RS-232. You
may not need RTS and CTS.

> To display data on the mac what do I have to do?

As far as software, I haven't the foggiest clue what is available for a
68k. Hopefully someone else can shed some light on that.

YES!!!

> I can't seem to find any serial port info nor a
> pinout in the D700 manual.

Huh?   RTFM   Page 2 of the second of of the two manuals that come with the
D700, "Specialized Communcations", manual shows the pinout in detail. It's
standard straight-thru pin-to-pin to a standard DB9 PC serial port.   The
only problem is Kenwood's idiotic use of the wrong SEX connector on the
radio's DB9. It's male instead of female so you can't use a standard
male-to-female DB9 "extension cord" cable AKA "AT Modem" cable. [
Traditionally, TNC serial connectors have been pinned-out like modems.]

The manual is downloadable in Acrobat PDF format at:

On the subject of mapping, I came across a Windows program that seems to
successfully decode the Garmin Metroguides and R & R maps right off the
CD's.  At least I think it does, it's in German and some of the instructions
are beyond me.  It appears the program is more geared towards generating
waypoints from the data, but that didn't make any sence to me.

Has anyone else ever used this program to get usable maps from the Garmin
software.  I don't know if it would ever be usable for decoding on the fly,
it took a solid 5 minutes on my Athlon 1.2 to decode a standard Garmin 8Mb
block of data.

Mea Culpa, Tulsa is using 9600 baud for EMWIN on 142.950 in Tulsa according
to www.srh.noaa.gov/tulsa/wcm/emwin.html . A contact is listed on the
website.

I just got feedback from a network admin about a virus running loose....
they reported to me that the virus is comeing from someone at bright.net.

Since I am onl only one list at this account, it must be comeing from
someone on this list.

73,
Bob - K8YS

He asked "running 9600 baud on 2 meters for APRS". I was not aware of the
EMWIN site.

BKJN> I just got feedback from a network admin about a virus running loose....
BKJN> they reported to me that the virus is comeing from someone at bright.net.

BKJN> Since I am onl only one list at this account, it must be comeing from
BKJN> someone on this list.

The worm in question, KLEZ.G (and varients), invades systems with
un-patched Internet Explorer and Outlook or Outlook Express, then goes
through all your message files and such, looking for email addresses.
It then choses one of those addresses, and forges its outbound
infection messages as being FROM that address.

Someone sent me a warning message, thinking that I was the source of a
message sent to him, but it turned out it was a Canadian subscriber to
one of these lists. Only an examination of the header would have shown
this...

Our server had rejected two attempts by the infected person's computer
to send messages to me, because it also tripped several of our spam
filters!

Rendered body type: text/plain

Greetings,

What's the latest info regarding WinAPRS and compatible map programs.

Are there current detailed maps available, commercial or otherwise, that are compatible with the latest version of WinAPRS? Last I was using an old version of Chicago Maps software.

Thx!

993. [aprssig] ARISS and PCsat operations.

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 30 Apr 2002 14:16:09 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-77259-2002.04.30-13.50.47--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'd like users of ARISS and PCsat to consider changing their paths slightly for those of us doing demo's indoors (2 May at Natl Air&Space Museum) Here are some frequently used paths:

```
UNPROTO CQ   VIA RS0ISS    for ISS
UNPROTO APRS VIA W3ADO-1   for PCsat
UNPROTO CQ   VIA ARISS     for either/both
```

I'd suggest adding "SGATE" on the end:

```
UNPROTO CQ   VIA RS0ISS, SGATE   for ISS
UNPROTO APRS VIA W3ADO-1,SGATE   for PCsat
UNPROTO CQ   VIA ARISS,  SGATE   for either/both
```

With the extra SGATE on the end, then someone giving a demo deep in the bowels of a building could simply switch his mobile to be a LOW power digipeater with the alias of SGATE. Then all packets coming down from ISS or PCsat would be digipeated by the mobile and receivable inside on an HT...

PCsat already includes SGATE in all of its packets, and the ISS sysops are considering it for the ISS packets. But the only way users packets will get digipeated into the building is if the users themselves include the extra SGATE on the end of their paths.

The extra SGATE does add an extra 7 bytes of overhead to every packet, but the potential benefit is quite great. Of course, people giving demos must make certain that they set their SGATE digi to low power so it does not interfere with anyone else nearby.

Rendered body type: text/plain

I just receive one of these worms sent to softlib@tapr.org (which is one of my numerous aliases). It had a spoofed "From" line with Brent Hildebrand's address, so it probably originated with someone with aprssig email in one of their folders. My Linux mail reader merely displayed it as hex data, no harm done.

The headers indicate it was sent from the following:

Name: sw-dsl-89-210.whidbey.net
Address: 209.166.89.210

If there are any whidbey.net DSL users on the list, beware! (plus run a virus scanner and patch your IE/OE).

cheers,

Bob N7XY

ENTER = continue, A = Abort, N = Next, C = cancel paging -->
Not sure about rest of Europe but according to U.K.
Band Plan Packet is not allowed on the 10 Mhz band at all.
So here in the UK we are using 14.105Mhz 300bd
lsb TNC or (14.105.51 AGW the same) because of this ruling.
Have a look at the HF page I wrote for MB7USK for more.

The "Half Size" can be dealt with by minimizing the half
sized screen so the X shows, then kill the window and open a
new one!

Now we also have to deal with using Precision Mapping on
more than one computer with WinAPRS!!

Jim,
  WinAprs sends requests to the OCX to zoom the map etc.  If the maps do
not update in response to mouse action or zooming, it is likely that the
interface between them is no longer working.  Try to search for a city,
street or zipcode.  If these functions work, then it is likely that OCX is
functioning properly.

I'm seeing the 1/2 size maps too.  I closed the window and re-opened and
it's still half size.  Also when I start WinAPRS, the maps revery back
to zoomed all the way out.  It doesn't remember the zoom level like the
```

older versions of WinAPRS.

1. Can't see the distance when measuring the distance between 2 points. If you minimize, it's not there. If you maximize, it's below the bottom of the screen.

2. Minimize and Maximize maps are the same size.

3. DF still doesn't work. The DF line doesn't show up if the starting point of the line is not on the screen.

2.5.1 would zoom down and the center of the screen would
stay the same. Not anymore. In 2.5.1 you could click on a
station or intersection and then page up or page down and
the new zoom level would be centered on that spot! Not
anymore.

After running all night and connected to RF and tcp/ip, the
home map was not where it was.

A lot of fixed stations are not where they were or are with
the previous setup!

No messaging capabilities.

Startup map windows not being displayed correctly.

PageUP/PageDN seems almost random for center of map.

HELP!

Robbie

To: ozaprs@careless.net; ui-view@yahoogroups.com
Subject: [OZAPRS] Australian APRS Internet Server Changes

Hi All,

There have been some major changes to the APRS Internet Servers (APRS IS) in VK.

A second national server second.aprs.net.au has been set-up in Sydney by Geoff VK2XJG. The two national servers (aprs.net.au & second.aprs.net.au) are linked to provide redundancy should one loose connections to the International (US) APRS IS. The two servers also provide redundancy with in Australia and New Zealand. This is achieved by the users of the servers setting up their client applications correctly.

The APRS IS aprs.cloud.net.au / VK3SB has been close down as an Internet Server due to changes in it's ISP's charging policy, but the IGate VK3SB will still operate as Victorias main IGate. All connections to aprs.cloud.net.au are now being redirected to second.aprs.net.au

aprs.net.au & second.aprs.net.au both run the same server ports which are listed below:

Port aprs.net.au:10151 / second.aprs.net.au:10151
Provides users with regional and international APRS traffic with 35 minute history.
(High traffic volumes)

Port aprs.net.au:10152 / second.aprs.net.au:10152
Provides users with regional and international APRS traffic with no 35 minute history.
(High traffic volumes)

Port aprs.net.au:10153 / second.aprs.net.au:10153
Provides users with VK* & ZL* only traffic. This port will allow messaging to and from any APRS station regional or international and also pass the associated position of the messaging station.
(Low traffic volumes)

Port aprs.net.au:1313 / second.aprs.net.au:1313
Provides other Hubs and APRS ISs with regional and international APRS traffic.
(High traffic volumes)

Port aprs.net.au:1314 / second.aprs.net.au:1314
Provides users with 3rd party station to station messages. All station to station messages from all data sources and a corresponding position report are available on this port. All other packets are filtered out. This is useful for clients that need to conserve Internet link bandwidth but want access to the global station to station message stream for Internet to RF messaging
(Low traffic volume)

Port aprs.net.au:1315 / second.aprs.net.au:1315
Provides users with UDP data from the International stream.
(High traffic volumes)

Port aprs.net.au:14501 / second.aprs.net.au:14501
Provides users with statistics and information on the aprs server in HTTP format
(Single screen)

UI-View Users

If you are running the latest version of UI-View 32 you will need to go to the Setup / APRS Server Setup and insert second.aprs.net.au:10153 into the

'Select One Or More Servers Box' and tick the box on the left. Then remove the aprs.cloud.net.au:10152 line by clicking on it and hitting the del key. In normal situations none of the Gate RF to Internet or Gate Internet to RF boxes should be crossed. If you need help hit the F1 key.

If you are running the latest version of UI-View 16 you will need to go to the Setup / APRS Server Setup and insert second.aprs.net.au:10153 into the 'Select A Servers Box'. Then remove the aprs.cloud.net.au:10152 line by high-lighting it and hitting the del key. Then select ether aprs.net.au or second.aprs.net.au as the APRS IS you wish to use. In normal situations none of the Gate RF to Internet or Gate Internet to RF boxes should be crossed. If you need help hit the F1 key.

The "out of position on fixed stations" turns out to be a random thing. If you page up/down or use arrows, the fixed stations move their positions as if the map is not drawn correctly each time.

Rendered body type: text/plain

I bought one to put on my wife's car. The "2 meter" antenna sits at 167MHz according to my MFJ analyzer. I cannot get a satisfactory tune on 144.39MHz. The GPS bit works OK but not great.

16. [aprssig] Precision Mapping map sizes

From: Mark Sproul <msproul@jove.rutgers.edu>
Date: Sat, 1 Jun 2002 11:53:59 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-82499-2002.06.01-11.30.09--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

As most of you are aware, it has taken me a long time to get the new Precision mapping to working properly. One of the issues it the map size, if the map window is not "square", then the map calculations do not work correctly and the stations do not show up where they belong. I will work on enhancing this capability in the future.

For now, when you resize the Precision Mapping map window, it checks to make sure its square and adjusts if needed. If you are having problems with maps not behaving properly, please resize the window and try again.

There will be a new version later today.

Mark

17. [aprssig] Rushing to meet pressure....

From: Jim Duncan <jdbandman@earthlink.net>
Date: Sat, 01 Jun 2002 12:13:59 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-82503-2002.06.01-12.49.47--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

One of the problems with working with software writing is trying to answer the requests for feature as well as the demand for upgrades. Over the course of the past 3 weeks quite a number of sig-grams have been thrown up wanting the annual upgrade of WinAPRS. Mark answered with a version that is obviously not ready for prime-time, but WHY?

To a degree, WE are the beta-testers of the software.

WE are the ones who all have different modes of using WinAPRS.
WE are the ones who can really put it through its paces.
WE are the ones who can (and do!) try everything.
WE are, therefore, the beta-testers.

Rather than complain and gripe about the software not being tested, we must all bear in mind that WinAPRS is, despite registration (which is EASILY circumvented!) a labor of love and accept our roles as the beta-testing platforms.

Hang in there, Mark and Keith! Everyone else: BE PATIENT! We've been spoiled for a couple of years with new releases that HAVE been extremely stable especially when they are compared to earlier releases.

At this point Mark has stated that another build will be out later today, so let's stop trying to nit-pick 2.6.0 for now and focus on preparing for 2.6.0a (or 2.6.1)....

Yes, This is being done a LOT...

There is very little problem with temp and gps operation....

Take a look at:

http://users.crosspaths.net/~wallio/GPSL2002.html

First I want to thank everyone for the input in getting these issues
resolved. The new version with as much as I could fix in a short
period is up on tapr.

Also, thanks to Bill Diaz, the latest version of the OCX is included
which has some bug fixes from Undertow software. Mainly a memory
leak.

Mark

WinAPRS 2.6.1 is now up on tapr

ftp://ftp.tapr.org/aprssig/winstuff/WinAPRS/

WinAPRS Version 2.6.1 - June 11, 2002
MacAPRS Version 3.6.1

Fixed message problem
Prec Mapping OCX updated
Prec Mapping window sized better

YES, SOME PEOPLE ARE BY PROPAGATING COPIES OF THE SOFTWARE AND SETTING
UP SYSTEMS FOR OTHERS USING THEIR OWN VALIDATION NUMBER THEN CHANGING
CALLSIGNS!  To me, this IS stealing.

> Your statement is without merit sir.

If I were the software author and discovered such piracy taking place, I
would be writing code into the software which makes any new installation
require a new registration code (not necessarily purchased but just as a
means of keeping track of how many installations a person does.).

Personally, I think that the registration price for WinAPRS is way too high for what is offered. If you pay a registration fee, yes, I think you should have the right to a "service pack" resolving bugs as they appear. Even Microsoft does this...

I have WinAPRS installed, and I didn't like the user-interface for a thing. Also, it's not stable enough to keep it running unmanned, without having to check it up 2x a day to see if it hasn't crashed. Hence, I did NOT register it.

Luckily, there is an alternative. It's called UI-View, works great with more features than 90% of all APRS users would ever need, the 16-bits version is FREE, and the registered version (32-bits) costs only $15. It's used almost universally in Europe for APRS. Why it hasn't picked up here is beyond my grasp. The author normally answers any please for help answers (or work-arounds for the occasional bug) within 24 hours, occasionally makes a "specialized" version for you, and many, many "plug-in" applications are available for special needs or interests. Check it out at http://www.packetradio.org.uk . Maps are not vector-maps, which some members of this list see as a disadvantage, but I'd say it's an advantage: you can provide any map you want yourself, or you can use the Microsoft Mappoint or Delorme Street Atlas plugins to use mapping program maps. The software is rock-stable; I personally have had it running on Win98SE and WinXpPro for weeks at a time without the need to reset.

I have no connection to the author (Roger Barker, G4IDE), or commercial interest in promoting this software, I'm just a very happy user of it. So if you don't like WinAPRS or DosAPRS, know that there are good alternatives out there...

Last thing I don't really understand is the use of the APRS-IS code as a program registration code. I'd say that this code is meant to authenticate that the operator of the software is a HAM, and therefore that he can safely be admitted to the APRS IS (with the risk/feature that his data gets re-transmitted over radio). A way to verify this, is to declare to the "author"/registrar of the software that you are a HAM, but it shouldn't be used as copy protection. So using someone else's activation code is not stealing software, but faking "being a HAM" with consequences for the packets that are uploaded to the IS and retransmitted over radio.

Another bug... mapblast does not work with the html webserver. When the gif maps try to display, with a client FIND request, the mapblast site responds with:

error: improper settings (In the middle of each of the 3 display maps)

The request html language is wrong to the site. I changed the request with a hex editor in my version of WinAPRS 2.5.1., and it works.

All I have to say is, write a program, publish it, deal with endless backseat coders, and see
what it is like to do it.  If you don't like the price of a program, don't pay it, and don't use
the program.  If the author is proud of his product, then he'll listen to suggestions and bug
reports, and do what he can to accomodate.  And remember, most of all: THIS IS JUST A
<deleted> HOBBY!  Most people have a real job.

If a product has not had enough testing and users are
expected to provide such, then the release SHOULD BE
MARKED BETA so that users would know to expect errors.

If not plainly marked BETA, users have a right to expect
that the product has gone through fairly decent
testing.

I have been a software BETA tester for over 35 years and
as such, expect to find errors.

This should be true for every product, ESPECIALLY THAT
FROM MICROSOFT.  Since it isn't, other authors feel that
they can do the same.

I am a registered WINAPRS owner but don't run it.  Found
something I like better and MUCH CHEAPER.  For the
price, the purchaser should not have to do BETA TESTING
unless they are advised IN ADVANCE.

Even long ago I NEVER installed a release that ended in
0.   That is a dead giveaway that more testing will be
needed before it works right.

I have my tracker up and running
It is a Kantronics and all seems ok etc.

I have a question, where in the settings do I change the ICON that I am
putting on the map as now I am a little boat (s) and I would like to change
it and I cannot seem to find where in my Kantronics KPC-3 that I change a
text string.

Your help is appreciated.

WA6JFK
Brian

Brian,

In the LTP 1-4 strings, The GPS?? sets the Icon in the
PATHS Like LTP 1 GPSLJ V RELAY, WIDE2-2
and so forth. The Very Questionable Page and several others
have this information that I rely on a lot, :-) Try
www.dididahdahditdit.com and look for KPC3 information for
trackers..

Good luck!

Robbie

----- RANT MODE ON ---------
Listen you nit-wits.

Mark and Keith are doing this as a HOBBY.

They have full-time jobs, family, and friends.

I'm guessing they probably don't make much profit from the program, but  it...

1.  Provides compensation for PITA (Pain In The "Posterior" ) factor of
processing registration requests to confirm Licensed HAMS and provide
authentication codes.

2.  Pays for the hardware and software (Computers, Radios, TNC's, Compilers,
Operating Systems, etc.)  they need for development. I believe the PMAP OCX
developer's license is something like $500-$600. And have you priced a
commercial C compiler for  Micro$oft Window$ lately ?. Not mention Internet
access, postage, and phone calls to support development of the software.
And I'm not going to get upset if they buy a few cool new toys along the way
too.

3. Pays for their trips to Dayton, TAPR DCC, etc. Not to mention their booth
space at those events.

4. Lessens the amount of heat they get from their XYL's about their expensive
hobby :)

As for bugs, etc.

1. They AREN'T Microsoft. It is just Mark and Keith. They don't have a legion
of Professional Software Testers and User Interface Designers to make their
application look "pretty".

It still amazes me that Microsoft, with all their resources and new "focus"
on security, keeps leaving serious security issues in their applications.
(Although I will take Microsoft LookOut! over Lotus Nuts any day, but that's
another rant).

Mark and Keith rely on US to test most aspects of the software, and inform
them of issues (and most importantly the conditions that cause those issues
so they can find the  root cause).
```

As for UI-View (which is a nice product), remember that they are working on a CROSS-PLATFORM product (Windows/Mac/Linux). You bet you can create a pretty nice looking Windows application using Bills tools and OS with all of it's neat bells and whistles, but then you are SOL when you go to the Mac or Linux. This means they have to create their own User Interface controls to maintain compatibility.

Plus trying to implement mapping software is HARD. Even more so when you are supporting multiple file formats (IMAGE and VECTOR)..

Like others in this thread have said.

Don't like it, Don't use it, and If you think you can do better, WRITE YOUR OWN !. Otherwise, DON['T WHINE.

If you honestly want to help Mark and Keith, test their software, collect data, and POLITELY send them the information they need to research and fix the problem.

Hi Brian,

I assume you're talking about WA6JFK-8, since that's the only station I find that looks to be using a raw GPS dump (kantronics tracker).

Here's the pertinent part of your data string, from findu.com:
WA6JFK-8>GPSLJ,RELAY*,WIDE2-1:$GPRMC.....

What determines the icon shown, is those two letters just after GPS in the TO CALL. Take a look at the aprs specification on the tapr web site. You can also look at the file that comes with AprsDOS called 'symbols.txt' - here's a link to it: http://www.dididahdahdidit.com/text/symbols.txt In there is a list of the letters that'd replace the x's in GPSxx for different icons. If I'm remembering correctly LK is a p/u truck - but check that first.

Then, after connecting a terminal (or remote sysop access) to your Kantronics TNC, change the path in your LTP variables from:

GPSLJ V RELAY,WIDE2-2
to
GPSxx V RELAY,WIDE2-2

Of course, replacing the x's for whatever letters will represent the icon you want to show.

Good luck!

Interesting approach you have when communicating your
thoughts.

This NIT-WIT thinks that if your paying for a product
or service or even evaluating it in the pre-purchase stage
you have the right to voice an opinion.

Who cares what the developers woes are, they are charging for it
and in the end they have to adjust to the market needs or get out of
the game.

Sorry mine and other peoples views conflict with your own.
Live with it and leave the name calling for the kids and lids.

```
OK, then I have a good solution. Most Microsoft packages are several
hundred dollars. Let's make WinAPRS $250 for registration, and then we can
probably arrange to have higher quality software. Oh, wait a minute, you
don't want to pay that large a sum of money for the software - which, while
every now and then buggy, is otherwise great? Then you don't get the
privilege to complain quite as much, nor should you have the expectation
that every problem should be fixed immediately when you contact the authors.

My final suggestion - remember all that stuff about camaraderie and
friendship in amateur radio? Perhaps you should step down off your high
horse and remember that this is just a HOBBY. If you don't like the
software, don't pay for it. Use UIView as much as you like. If you are so
qualified, write your own, and sell it if you can. Please don't sour the
opinions of those of us that are brand new in the APRS world by making us
think that the entire project is being held back by a few crotchety
individuals. I'm on this list to read about the system, not to listen to
sermons.

My $.02. Flames direct to me please.

Let all the people who want to bitch & complain keep at it. Officially notify the Sproul's and everyone here on the SIG. I don't get enough junk email as it is ;-)

Then the Sproul's can send a real world bill for their time to the whiners.

The rest of us that appreciate their dedication will just wait patiently as we always do.

Thanks for your opinion,

I respect your views. I just don't agree with them.
I don't have any problem with paying for software.
Re-Read my posts, I advocate Free Speech and Opinion.
I don't think calling people NIT-WITS is very productive.

You have your opinion and I have mine.
Lets just leave it at that and be friends ok?

As far as I am concerned this thread is over

73

Most of the software we are using for APRS is written as a HOBBY. APRS itself was written and designed as a HOBBY.

The other authors also have full time jobs, family, and friends.

Compared to other products the profit margin seems pretty high.

Nice if you can have your HOBBY pay for all your equipment and development software.

Trips to Dayton, TAPR, DCC, etc. NICE HOBBY

Why do they have to confirm for licensed HAMS? User responsibility not the vendor. FCC is not going to fine them if a NON-HAM buys the program. It is very useful for a non-ham. Software is not a transmitter so is not covered by FCC rules.

Hassles from XYL's are usually part of ANY HOBBY.
Boats, Cars, HAM RADIO, Home Automation, etc.

Never said that Mark and Keith were in any way like Microsoft. Just don't be is such a hurry to provide a feature and put it out there before it is ready. Makes users upset (as seen here), and gives the product a bad name. Better to wait and get it right. I'm not saying that it should be bug free. NO SUCH THING. Users are always going to try and do something that an author never even dreamed of trying. Been there, Done that. Been writing mainframe software for over 40 years.

Never said that writing software was easy. But that is what you are paying for. When you have the highest priced software product for the job, you expect better quality. Same for almost everything. I expect better quality from a Lincoln than I would from a Hugo or Chevy. When you pay more, you expect more.

I bought WINAPRS and paid the fee. Use UI-VIEW for the features, ease of install and use. AND THE MAIN REASON is the author seems to stay up 24 hours answering questions about the product even though the answers are usually IN THE DOCUMENTATION.

I met both Mark and Keith as well as had a nice chat with their Mom and Dad. They are dedicated people and providing a needed product. Just need a little more time to test before putting it out there for use. Everyone gets frustrated when a product comes out with features that you have been waiting for and then it doesn't work right.

On another short topic, when you send replies, why put
the sig in the TO AND CC address? One or the other will
do the job.

43. [aprssig] WinAPRS Weather Display bug or ??

From: Ken Brown <W2KB@compuserve.com>
Date: Sun, 2 Jun 2002 11:30:20 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: Mark Sproul <kb2ici@amsat.org>, Keith Sproul <ksproul@rci.rutgers.edu>
Message-ID: <LYR842-82708-2002.06.02-11.07.25--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Keith / Mark,

I've upgraded to WinAPRS V. 2.6.1 and it is running fine so far under XP
Home Edition, except for the previously reported not remembering zoom
levels of the maps but,

I cannot get the software to recognize and read in the WeatherDisplay data
file.

I have the "WX Display [file]" checked and in the path file have:

"C:\WinAPRS\data\WXNOW.TXT"

The WXNOW.TXT file generated by WeatherDisplay is updating every minute as
it is supposed to (in the above subdirectory; a typical example is:

```
Jun 2 2002 10:40
259/001g003t073r000p001P000b10037h40
```

Another sample:

```
Jun 2 2002 11:16
321/003g009t072r000p001P000b10041h41
```

In Weather Display, I have set to "no" all three questions:

Use daily maximum gust
Have /fWD at the end (of the data)
Allow 100% humidity (h00)

(Changing all combinations and permutations of above to "yes" made no
difference.)

None of the weather information gets into any screen of WinAPRS, for
display or transmission.

When I use a "send weather" command in WinAPRS, a alert box opens:

"Weather data is invalid or too old (check cables)"

Of course, there are no cables since it is supposed to be looking at just a
file, so that's not an issue like with the weather station options. The
data strings are as above, and look reasonable?

The XP computer's clock is set to local time (EDT). The WinAPRS UTC offset
is set to negative 4. Changing the times and offset all to UTC made no
difference.

Findu recognizes FTPed via Internet APRS weather data that WeatherDisplay
directly sends out via dialup modem and my ISP so WeatherDisplay is

properly processing the Rainwise MK-III logger data for that purpose.

Any help on getting the WeatherDisplay file working with WinAPRS will be
greatly appreciated.

Thanks 73

Rendered body type: text/plain

Ken Brown, W2KB, helped me figure out a minor problem in the Weather
Display feature of WinAPRS 2.6. So, currently, Weather Display input
to WinAPRS is not working.

We will have this fixed shortly, but it won't be up on TAPR until next weekend.

In the mean time, if you have the Weather Display program, please let me know..

Keith Sproul

45. [aprssig] IGATE/RFGATE: Help me to remember, please...

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Sun, 02 Jun 2002 13:12:05 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-82723-2002.06.02-12.48.36--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Assuming that I am listening on 144.39 MHz...and an icon appears from a
great distance away, how would I know:

```
o that the APRS packet originated on RF, was IGATED to the
  Internet Stream and then RFGated back to RF, based solely
  on what appears in the APRS frame that my station decoded?

  - I'm thinking that IGATE's place TCPIP as a 'digi alias' when they
    pass info to the Internet Stream...but I can't remember for sure.

o the callsign of the IGATE that RX'd the RF and GATED it to
  the Internet Stream?

o the callsign of the RFGATE that RX'd the frame on the
  Internet Stream and RFGATE'd it back to 144.39?
```

I'm running on little sleep and am having a tough time remembering. I was
about to give some input to someone on a related topic, but didn't want to
provide incorrect information.

Regards,
Ev, W2EV

I believe Terry's point is once you start charging customers for a product the customers reasonably expect something in return. BTW, the XASTIR (a free open source APRS software) has a interesting way of addressing complaints about their software.... if someone complains they hand that person a copy of source code and say fix it themselves. Now, you do make the plausible point that maybe WinAPRS is priced too low... that very well may be and possibly the price should be raised and/or a yearly update fee be charged.

But the point is, once you start charging customers for a product those same customers start to expect something in return. The fact that the seller may or may not be charging enough to redemn their labor is not the customers fault or concern.

Welcome to the real world.

>My final suggestion - remember all that stuff about camaraderie and
>friendship in amateur radio?

I believe Terry was responding to the fellow that was using the term "nit wit". At that point one could make the assumption that "camaraderie and friendship" had left the building.

If the Sprouls charged the amateur community a "real world" price for their work, APRS would not be what it is today. Most of us could not afford it or would refuse to pay the price.

Paul:

I don't understand your point. The team that does XASTIR charges $0 for their
work, yet they make a fine social profit. Their profit being it is something
they enjoy (i.e. a labor of love). Profit does not need to be monetary,
however profit always is in balance.

What I suspect you are saying (and we can only guess) is that the Sprouls
profit consists of both the price they are charging as well as the undieing
accolades of those in the APRS community? Certainly they deserve that, but as
a new users to APRS, is this contract clearly enumerated in their licensing
agreement? (i.e. Yee shall not complain if Yee don't like something.)

This is what I meant by the real world. In the real world, if a customer pays
money for a product that customer has certain expectations. Or are you
suggesting APRS is not the real world? (and that is clearly a possibility)

Jeff

I have flown this model of GPS as high as 95,000 ft with no
problems. I keep the unit inside the payload so it's not
completely exposed to the outside air (which can be as low
as -90F. I have tested the unit to -20F with no ill effects, and
in flight the GPS does not get that cold inside the payload.

Wonderful discussion (sarsasm).....

Just proves the old adage about what they say about hams......gripe, gripe, gripe....

You don't like (WinAPRS) the program? Don't buy it, don't "steal" it, don't use it....

(Interestingly enough, $60USD is about $100CAD up here, yet a lot of Canadian HAMS purchased it.)

I don't think $60USD is unreasonable considering the bulk of HAMS on this list are also owners of much more expensive hobby items, such as:

TNCs, Desktop Computers, Laptop computers, power supplies, feedline, HTs, Mobile radios, base radios, antennas, Tigertrackers, GPSes, etc. How much do you think all of this stuff costs? A heck of a lot more than $60....

I've had the program since 1997-1998, I still can't remember the last time I purchased software and continued to receive software updates for 4+ years.

Furthermore, while more APRS (software) alternatives exist today, there weren't that many choices years ago. APRS has advanced a long way in a relatively short period of time, due in a large part to the WinAPRS (MacAPRS) software which helped bring this facet of the hobby a lot more exposure.

How about a little gratitude, folks.....

Tino, VE6SZR
Calgary, Alberta

Rendered body type: text/plain

All,
We have a local IGATE running WinAPRS and it appears it is converting (incorrectly) MIC-E packets and managling all of our D7s on FINDU. Is there a switch anywhere to turn off MIC-E conversion? If not, while small things are being fixed on new WinAPRS, can we get the Sprouls to add a switch to turn it off, the conversion should be done by the end programs, not the IGATES.

And paint it black and you can make it as hot as you want. Remember the sun is 100% up there and you can use it to get any average temp you want if you paint it the right color and use good thermal design.. There is no reason at all for balloon payloads to get cold...

We put ours inside a 2 qt plastic coke bottle and the temp only went UP from our April launch... 70 deg F launch.

I have a page up which I hope will show emergency beacons received. I know it will show converted Mic-E packets, and I'd like someone to with a D7/700 somewhere in an area where Mic-E are not converted to send one test beacon. I know this will trigger a few alarms, I'd suggest setting your callsign to TEST so there is no confusion. Before doing this, please be sure that your Mic-E packets are getting to findU without conversion, (use find.cgi to see that the raw packet is unreadable) and that no one else has gotten a packet through (look at the emergency page:

http://www.findu.com/cgi-bin/emergency.cgi

Remember the PEAPRS test period begins tomorrow...use the above cgi and/or the message cgi:

http://www.findu.com/cgi-bin/msg.cgi?WA2ZXS

Anyone have any idea why I would get weather bullitens from the Wx Server on my TCP/IP only APRS Station and not on my RF/TCP-IP station? The are both monitoring the exact same APRS server.

Thanks,
Eric KF4OTN

No need for further testing, it doesn't work, and I don't have time to
work on it now, hopefully in the morning. In the meantime the page
will pick up the converted packets...

I have my Igate set up to transmit the messages from WA2ZXS to the local RF
guys in my area when they happen.  I do not know if this is the right thing
to do, but I figure it will give the RF side of the house a chance to
respond as quickly as possible!

And can someone please repost the ARRL bulletin or send it to me...I lost it
(the bulletin that is...well, maybe!).

The Air Force Research Lab, Rome (New York) Research Site, will conduct an experiment using Amateur Radio operators as an auxiliary line of defense against aircraft disasters. The Precision Emergency Automated Position Reporting System (PEAPRS) test will be carried out in conjunction with the annual Team Patriot exercise. The ARRL is co-sponsoring the test.

The test will consist of two aircraft flights sometime between June 3 and June 8. During these flights the aircraft will transmit a distress message, using the call sign WA2ZXS. Amateurs wishing to participate in this exercise should, upon receipt of the distress message, send an e-mail message to peaprs@rl.af.mil detailing the time, characteristics of the message received and the method they used for reception (direct, via digipeater, via wide relay, Web, etc).

Those lacking e-mail capability may participate by calling their observation info into the PEAPRS Command Center at 315-330-7444.

The objective of this exercise will be to measure the timeliness and accuracy of the reports received from the amateur community. Amateurs that participate in this program will qualify for a special certificate from ARRL recognizing their participation.

I have only been into APRS for the last 6 months. First thing I did was buy WINAPRS, AGWPE, UI-VIEW, Weather Display. Still have not installed WINAPRS.

I don't mind spending the $ as long as it works.

You should expect more from priced software than from freeware but that is not always true. But I still expect it to work and get support. That is why you buy. It provides the assumption that it works and is supported. Lots of problems and lack of support is a scam.

You don't need to be a ham to gripe. Just a purchaser of the product.

Hi Don,

Too bad you feel that way.. I have had 2.61 running
flawlessly for 48 hours on an AMD 200, Win2000, and all the
bugs mentioned were taken care of in the first 24 hours,
(maybe sooner, was not timing it!), leaving only one issue
unresolved. That is the "Square" window needed for now to
place positions correctly. I'm confident Mark will get that
resolved when time allows!

In the meantime, I for one am enjoying the fruits of their
endeavors! Lets move on...

Robbie

I can not speak for all the maps out there however, WinAPRS V 2.6.1, which
was just released allows use of
Precision Maps v5.0 and it is pretty nice down to street level. There are a
few bugs but nothing major with the release.
There are quite a few maps out there.

Nope; Not Really.
It's kinda' pathetic; if you ask me.
It's not like 10.151.5 is a HOTBED of DX.
20M is MUCH better for good APRS DX.
You will see a LOT of Europe; all over,
if you stay on most of the early/late
afternoon....if the band is OPEN; you will see
posts quite often, but NO ONE from N America!
" Go Figure ".

I had hoped this one was going to be fixed after so much repair time.   After less than a day of running 2.6.1, I have greeting me:

one window of: "Main Application appears to have died Terminating Thread"
4 windows of: "Insufficient pointer space, please inform authors (NewPtrClear)"

I think I'm connected to the same Internet as the authors, so I'm confused why they're not seeing this. How many days of uninterrupted operation will there be before a version is considered safe for distribution?

67. [aprssig] KPC-3 Resetting

From: David L Norris <kg9ae@webaugur.com>
Date: 02 Jun 2002 23:48:27 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-82820-2002.06.03-00.24.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm having trouble keeping a KPC-3 in converse mode. Every few (5-10) seconds of operation it will display the version info and drop to a cmd: prompt. This is a recent occurrence. It ran fine for quite a long time but has been disconnected for a few months. It's not resetting as a result of RF; the transmitter is disabled.

```
Does anyone have any idea what would cause this behavior?

Mine started to do this when the back-up battery went bad.  I did'nt think
it would affect the TNC's opperation due to the fact that it's there to
BACKUP information when turned off.  But, I replaced it and my KPC-3 has
worked fine ever since.
Hope that helps,
73's

I forgot, I also had this problem when I had a problem with the TX line
feeding back into the RTS line.  That caused the TNC to do all kinds of
crazy stuff., not just reset.

I don't think most people using HF APRS (at least in the US!) are trying to
set DX records.  They are trying to get their posits into FINDU from remote
areas where there is no 2-meter coverage.  For this purpose, 30M is
excellent, providing coverage of half of North America (or more) around the
clock, ensuring you will always hit several IGATES or HF-VHF gateways
anywhere, anytime.

Nope; Not Really.
It's kinda' pathetic; if you ask me.
It's not like 10.151.5 is a HOTBED of DX.
20M is MUCH better for good APRS DX.
You will see a LOT of Europe; all over,
if you stay on most of the early/late
afternoon....if the band is OPEN; you will see
posts quite often, but NO ONE from N America!
" Go Figure ".

> Is there any HF APRS activity besides 10.151?

I've been watching this thread with interest. And I think some people
miss
the key point.

Customers paid for the software.

I really don't care why the author did it. I don't care what the problems
are.
I don't care if the only profit they make they only use to go to shows.

Someone paid them for a product.

If the reasons WHY someone collects money was part of the deal, then
that really has to be up front and PRIMARY to why the customer is paying,
otherwise it doesn't really matter.

Someone raised the issue of price. If price matters, then I can show you
software that is INCREDIBLE for a mere $35. I can also show you
software that is TERRIBLE for thousands of dollars.

It all comes back to a customer PAID for a product, and a vendor
elected to take that money.

Now it comes down to the relationship that vendor wants to have with
the customers. And how the customers feel about that relationship.

If they want to complain, or even take more pro-active steps about support
or lack of it, then they have every right to do so. If the vendor wants
to
keep the customers happy, then they have every right to do that. The
vendor has selected the relationship to the customer.

But PLEASE don't lay the BS on everybody that it's a 'noble effort' or
that
the profits only go to trips or other 'noble' purposes. I'm sorry, that's
just
fluff.

Mike

I think other people miss the real key point.

Customers paid next to nothing, in terms of commercial software, for
the product, and have gotten years of free updates.

>If the reasons WHY someone collects money was part of the deal, then

Sure, and the $35 software is an incredible bargin and the thousand
dollar software an incredible rip-off. Both exist in the world, but
for the most part, you get what you pay for. You certainly shouldn't
expect every $35 software package to be incredible. For every one of
those you can show me, I can show you a thousand that aren't.

>It all comes back to a customer PAID for a product, and a vendor
>elected to take that money.
>

Sorry, I couldn't disagree more. If I pay the neighborhood boy $10 to
cut my lawn, I shouldn't expect the same quality as if I pay a
professional landscaping company $200. That's not poor customer
relations on the part of the boy, that is just common sense on the
part of the customer.

The Sprouls never promised perfect software, even Microsoft wouldn't do that. Everyone had a chance to try WinAPRS before they paid their money, and everyone had the option to use it forever without paying, the only crippled features are saving preferences and IGating. The rest was, and still is, free.

What you paid for was the convenience of not re-entering your info every time, and to support ongoing development. Not for perfect software. Stop expecting that!

Whining like this thread is exactly the reason I won't charge for ham software...not because my stuff isn't worth it, not because I wouldn't like some extra money, but because some people think once they lay a few dollars on the table they are entitled to hours of time, and that just isn't right.

Fifteen years ago I wrote a line of patch editor-librarians, marketed under by Valhala in Michigan. Musicians as a group are much poorer than hams, but far less cheap. I did not have this problem dealing with them, and sold thousands of copies. After that, I wrote a shareware hurricane tracking program for the Mac, and never had a problem there either. Those programs weren't perfect, far from it, and neither was my customer support. However, those customers did have realistic expectations. For whatever reason, many hams lack realistic expectations.

At times the character of some hams makes me want to throw in the towel, as I'm sure this thread does to the Sprouls. What keeps me going in those times are my logs...I look at the thousands of users of my software that are silently appreciative, as well as the many nice emails I receive, and I remember that those are the people I'd be hurting. I hope Keith and Mark do the same here and not let the opinions of a few people drive them away...

Nobody missed the point. Yet, everybody missed the point.

The bottom line is you have the right to do anything you want, but you should also be reasonable in your expectations. When you exercised your right to register your software, you agreed it was worth the money expended. If you did not exercise your right to test it out, then why are you blaming and criticizing the Author. You did not buy lifetime support for the software. You simply registered what you got and agreed it was worth the registration fee if you paid it. Who do you blame for this?

The software Authors have to be incredible people taking the abuse and yet they continue to fix software and add enhancements at no additional cost to the end user. My calculator works well and I would estimate that most of the software Authors are lucky if they break even to cover their expenses and their time based on the number of APRS stations on the air. Why do they do it? Obviously, they love their hobby. Why not try to encourage and thank them for their continued support of the software that you receive for free.

My hat if off to all the software Authors for their dedication to the hobby.

Hi Steve,

Just a comment and clarification.

Firstly nobody speaks my mind for me -- except me.

You and I cannot possibly assign value/worth to anything for another party.
That is a personal decision based on mitigating factors
to THE END USER. In essence, value is in the eye of the
beholder.

Nobody is putting the Sprouls down, certainly not me,
As a consumer, No matter the price  the ability to critique
and praise is an inherent right in a democracy.

My Beef is solely with those who would seek to
silence the voices of opinion and thought.

Nobody BUT Nobody has questioned the SPROULS hard work
and dedication to the Amateur Radio Software BUSINESS
they have BUILT.

Your Opinion is yours, just as mine is mine.

My opinion is that if you pay for something you have a RIGHT
to voice your opinion regardless of the VALUE the software
VENDOR assigns to the PRODUCT.

 I trust that you understand my position even though
you may disagree with it.

Peace and 73

 Terry

80. [aprssig] Bug in Peet Brothers U2K firmware - Packet Mode only

From: Richard Parry <rparry@actionware.sdcoxmail.com>
Date: Mon, 03 Jun 2002 08:34:25 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-82932-2002.06.03-11.10.40--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

About 3 months ago I purchased a Peet Bros weather station. It did not work as I expected in the Packet Mode. It showed NORTH almost continuously. I "assumed" it was my ignorance of the unit and switched to the Data Logging mode for my application.

After gaining some confidence over a period of 2 months, I gave the Packet Mode another try, it still showed north almost constantly. I called Peet Bros. and found they were familiar with the problem and were aware of it. The problem only affected the Packet Mode. They were very nice and agreed to send a replacement.

If you are not sure if you have the problem, I am sure you don't because it is very so obvious. Peet Bros. tells me that the wind direction fields were not updating only in the packet mode, so in my case the wind direction was virtually always north.

I mention this in case there are folks out there that noticed this. I mentioned the problem here on the list a few times and no one said they saw the same problem, so I assume that it is just me.

later,
Rich Parry

Rendered body type: text/plain

```
Over the years I have had occassionaly intermittant handheld satellite
comms during spur-of-the-moment demos.  But on bench testing, sometimes I
can reproduce the bad connetion, sometimes not.  Always suspecting it was
in my connectors, I re-did them a number of times.  But sooner or later it
happened again.  Like today.

This time I was determined to figure out what was going on and
narrowed it down to the right-angle SMA going into my TH-F6.
Then i measured carefully how far down an SMA would have to go
to be get everything flush and realized that because of my
frequent antenna changing, I was never really torquing down on
the SMA, but only twirlling it on until finger tight.

Duh.. today I realized that is only the point where the
concentric grounds (and center pin) BEGIN to make contact.  It is
a full almost 1/8 inch beyond that that is necessary to fully
mate the connectors...  Sure enough,  If I continue to torque the
connector, it goes another 2.5 turns!

That has been my problem all along.  This was my first time using the
TH-F6 and so the conector was new and so the fit was tight at first.  So
what was "finger tight" and OK on my TH-D7 (well worn connector) was
stopping way short on the new copnnector.  This also expalins why the
problem also aleays seems to fix itself.  When the connector wears down a
bit, then "finger tight" is a different ballgame than before...

ANyway, for what its worth..
Bob

Well all I can say is that after watching all of the commercial attempts at
AVL and the costs associated with them, I have been a very happy consumer of
WINAPRS and was glad to pay the price for the version I registered with the
known bugs at the time. The fact that I get all of the updates for free is
just a bonus. I just want to say thanks to the brothers Sproul for their
work! I am happy to help them troubleshoot the software and do my little
part to advance our hobby and this particular mode.

Thanks again for your product and it's continued development.
```

Rendered body type: text/plain

I would like to thank:

1. Brent Hildebrand for APRS+SA. A solid workhorse, does everything but massage, built like a tank and runs error free for months, even as an Igate. A+++ customer support.

2. The Bros. Sproul for WinAPRS. Fast, low resource requirements, easy to configure. Lots of zany new ideas.

3. Mike Musick for pocketAPRs. Brilliant little implementation for the Palms. Amazing.

4. Bob Bruninga for dosAPRS, which got this whole thing started and still plugs along doing it's job. Lots of zany new ideas.

(listing only those programs which I have personally registered)

All of them at various times have bugs. (Although trying to find them in APRS+SA is a challenge) Each author has his own approach. Brian's stuff comes out very well tested, even his interim releases.

It pays to know what you are getting into before paying the reg fee. There are several considerations:

1. Software capability/features/platform
2. Reliability
3. Customer Support
4. Cost.

I have my own expectations for each of the criteria as I apply them to software. The fact is, each of the authors has a "mix" in how they measure up in the four areas. The purchaser needs to sample the installed user base to find out what the general opinion of the software is.

This leads to some pretty strong language that may be a bit over the top. In the end, users vote with their headers. I note that typically the first 15 to 20 Igate leaders in messages handled seem to all be running APRS+SA. There are obvious reasons for this, some of which are a function of the incredible reliability of APRS+SA, and another factor is WinAPRS resets it's count every time it gets shut down and restarted. I also note that the installed user base of WinAPRS is the vast majority. There are obvious reasons for that as well.

Bottom line:

There's a LOT of really good software out there for APRS. We need to communicate to the authors what we think directly, and make observations that are courteous and fair-minded when doing it in public. Some of it MUST be done in public. Without it, users can't tell what is really going on, and sometimes the authors priorities are not shifted until a major problem is openly discussed by a multitude of users.

Users need to use a little restraint and authors need to exercise patience and not take things too personally. I'm sure it's not easy for any of us. We just need to find the right balance between raving critics and gushing sycophants as users.

73,

...hasan

No doubt,

WINAPRS and MACAPRS are a good package.
The Sprouls do their best as they can.

Igate.
> A+++ customer support.

Our local IGate running APRS+SA under Windows 95B on a IBM P166
computer was up for over 150 days of continuous operation until this past
weekend. There are only few things that take it off the air. Mother nature,
the power company (when the UPS runs out of juice), and when we upgrade
the software like this past weekend. 150 days of uptime at N8DEU-4 was
very good, but we just had to upgrade the software to change the IP service
this past weekend and restart the cycle. May it run until a new update
arrives
that we cannot resist to load...

Time to move on. All of the arguments have been heard and my mind hasn't
been changed. I haven't joined in the fray because, I knew my thoughts
would be expressed at some time. It was. Again and again.

What's my thoughts? Doesn't matter, they have already been expressed.

88. [aprssig] WinAPRS 2.6.1 - Objects & TCPIP

From: "Jim Gill N0RMO" <n0rmo@jgav.com>
Date: Mon, 3 Jun 2002 16:32:42 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-82985-2002.06.03-17.10.16--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm trying to enter an object for a Fire in CO. I've named it, set the
right coordinates, set it as active, and I have my position report rate for
VHF and TCPIP at 30 minutes. When I hit OK after entering the object, it
goes out over local RF but it won't send over TPCIP (it never shows up in
the history list as sent to TCP) and I am connected through AFilter to

AHUBCA - my positions and status packets are getting there. This is what I see in my History list:

```
>xmit To HF >IRON     *032123z3821.40N/10527.40W: Iron Mtn Fire 6400 Acres
>xmit To VHF>IRON     *032123z3821.40N/10527.40W: Iron Mtn Fire 6400 Acres
```

It shows HF and VHF but not TCP. Also, I've noticed other objects on the APRS-IS stream have a ; (semicolon) before the object name, but mine never does. I think that has to do with third party traffic?

Anyway, even though my object is getting digipeated locally, it doesn't have a position on FindU and won't show. Other objects in that area are showing on the stream and FindU just fine.

Any help? Thanks-

{winaprs 2.6.1, W2KPro, AFilter 2.6.9}

I hope this is a variable rate? If someone is putting urgent data onto
APRS it should go out immediately with a few repetitions. The last thing
we want is for an urgent object to collilde once, and then never be seen
by anyone for the next 30 minutes...

SImilarly we dont want each person to have to set a 1 minute rate
initially, and then forget about it... and saturate the network during a
crisis with adnausium old data...

Please telll me the vairable dedaying rate is automatic?

Bob,

Yes, it is variable, you can enter the specific amount of minutes you want.
See http://www.jgav.com/ham/images/tx-rate.jpg for a screen shot of the
WinAPRS 2.6.1 position report rate dialog. I don't think the rate decays,
though, I believe it is fixed at the rate you enter.

Thanks.  Then that is not what I meant by variable.  APRS was designed to
account for new data more frequently than old data.  New data has to be
sent often enough to assure that everyone gets the new data quickly, but
that old data is phased out of the system.

In APRSdos, a new object (or any new packet) is sent immediately, then 16
seconds later, then 30, then 60, then 2 mins, then 4 mins, then 8, then 16
before it finally gets down to the 30 minute rate.  This assures that
every one gets it fast, and yet in only a few minutes it is no longer
bothering the network, while still making sure that latecomers get a copy
eventually.

I hope everyone can see that sending any kind of real-time object at once
every 30 minutes on a busy APRS channel where things are lost by
collisions will have significant problems in updating everyone.  And
similarly if the user has to remember to change from a HIGH rate to a low
rate manually, that again, this will lead to big problems under stress.

If a program cannot do decaying, then maybe an automatic send once a
minute for 5 minutes and then drop to the 30 minute rate...?

Bob

```
A followup on my Fire object scenario: a snippet from my History file
again - Winaprs 2.6.1:

>xmit To TCP>FIRECO602*032256z3821.40N/10527.40W: Iron Mtn Fire 6400 Acres
KC5MVZ-4>APRS,KC5MVZ-2*,WIDE4-3:!3339.48NN10114.30W#PHG9230 LACC WEATHER
TRACKER DIGI
WD4BIS-3>3RUS6R,WIDE3-2:`|>}m+fj/"5X}TinyTrakII TWTC Company Truck
N0RMO>APW261,TCPIP*:FIRECO602*032256z3821.40N/10527.40W: Iron Mtn Fire 6400
Acres

Apparently WinAPRS *will* send the object out at the specified interval (I
changed mine from 30 mins. - the recommended by Winaprs - to 10 minutes),
but it won't send it out via TCP "on demand" (Settings>TNC Commands>Send
Objects). It only sends TCPIP on its interval.  Or so it looks here (changed
the object name due to a suggestion from another list member).

BUT, it is still not showing on FindU.  I assume it still needs another
character of some sort after the first Colon.

Someone was curious how objects are entered in WinAPRS - an entry/edit
dialog box screenshot is at: http://www.jgav.com/ham/images/object-edit.jpg
```

Jim N0RMO

```
>>xmit To HF >IRON     *032123z3821.40N/10527.40W: Iron Mtn Fire 6400 Acres
>>xmit To VHF>IRON     *032123z3821.40N/10527.40W: Iron Mtn Fire 6400 Acres
```

>It shows HF and VHF but not TCP.

Rendered body type: text/plain

I threw this together this morning. I appologize if you get more than one copy.

anyway this is about the SAR 2002 weekend here in Arkansas, where ham radio and APRS played a vital role!

73 de Scott, W5JSR

. . . of Hounds and Hams

During the weekend of June 1st, 2002, Search and Rescue teams from all over Arkansas, met for Rescue 2002. Held in the sleepy southern town of Nashville, AR, the annual conference met for the forth time in a beautiful city park. Teams arrived from all four corners of the state on Friday afternoon and evening. By Saturday morning, more than 80 SAR members had arrived.

The Howard County Search and Rescue (HCSAR) team sponsors this event for the purpose of training teams across the state to use similar methods and procedure and to share new ideas. Several training classes were held during the weekend and included two classes about Amateur Radio. In fact, of the 80 SAR members present, one-third or more were Amateur Radio Operators! One of the requirements for membership in HCSAR is that you hold an amateur radio operators license or are in the process of obtaining one.

The HCSAR team communications officer and ARES EC is J.B. Davis, N5THS. This year J.B. asked two hams, Scott Ratchford, W5JSR, ARES EC for Benton Co., and Mike Engelke, KD5DGT, Asst. ARES EC for Benton Co., to come down and give two classes. Scott and Mike accepted the invitation and came down to offer classes on Introduction to Ham Radio and APRS.

Friday night, Scott, gave a short class on Amateur Radio. "I teach ham radio classes each month in Benton County and I wanted to show that SAR members at the seminar a simple way to study for the Technician class license and show them some of the new equipment available today. I use the ARRL "Now Your Talking" handbook for the class and explained how to use the book", Scott said. He also touched on Amateur Radio's role in emergency services and about ARES and RACES. "After the class, I had several SAR members ask further questions and they presented a real interest in obtaining their license!"

Saturday morning, Scott and Mike, worked together to present a program on APRS. "Last year we came down for the first time to give this class and we were successful. This year we came down to again present the class, and to test the program in a "real-world" situation. Our class was well attended and we presented an overview of the APRS program features", Scott said.

APRS, the Automatic Position Reporting System, is a program created by Bob

Bruninga, WB4APR, that uses GPS receivers and Amateur Radio to track objects. APRS uses a connectionless form of packet radio to transfer information and is capable of tracking objects in real-time. This is a program that has many uses, and is capable of delivering messages instantly to any other APRS station. "This program is perfect for situations like this, where you need to know where your SAR teams are at any given moment," mentioned J.B. "We can track our teams out there that are 2 miles away and show it on our laptop computer here in the command vehicle. I think this technology will help us on our searches and we will add this to our setup"

A good portion Saturday afternoon was dedicated to field testing and a mock search. There four K9 and search teams that were tasked with finding several lost persons in the woods. "We put three tracking devices (made up of Kenwood TH-D7A radios and Garmin GPSs) on search teams and used the APRS program in the HCSAR command vehicle to present a visual clue of team locations to the Incident Commander. The three teams that we tracked were taken about two miles away to a staging area. We were able to watch each team as they left the area and began their track", Scott said. "We set the tracking devices to beacon a position every 30 seconds. The APRS program captured the path that the teams took and we used that data to overlay a track on the map that would show us where the teams had been and areas where they missed." The field test lasted about 2-1/2 hours.

That evening after the mock search, BBQ chicken, it was time to hold a debriefing. The debriefing began with an over view of what was seen on APRS. Scott began with a map of the area search and outlined the path of each team. After the debriefing a question was asked of the SAR teams, "What would you like to see more of next year? What can we do to improve the conference? The answers were, "Communications", "Ham Radio", "GPS" and "APRS"!

Search and Rescue 2002 was a success for Amateur Radio as much as it was for the SAR teams that were present. There were too many hams there to mention individually but among them were, N5THS, W5JSR, KD5DGT, KD5EYX, KA5ZYY, KC5BYB, KB5SSW, N5YKL, N5XFW. Also present were representatives of the Arkansas Department of Emergency Management, Arkansas Fire Academy, and several County level DEM managers. A lot of information was passed, a lot of training programs offered, and it was made clear that Amateur Radio will remain to be a vital part of Search and Rescue in Arkansas!

This is really terrific, thanks. You should submit it to the ham magazines
for their public service columns.

Congrats Bob on being inducted to the CQ Amateur Radio Hall of Fame.

The list of new inductees to the CQ Amateur Radio Hall of Fame contains
some names familiar to most amateurs. Among those honored by their
inclusion in the class of 2002 was Bob Bruninga, WB4APR

```
Let us hope we never witness the "Silence Of The Hams"

I have a laptop and it doesn't have a 9 pin serial port. So I went out and
got a USB to 9 pin serial PDA adapter. I got an XP driver from the
manufacturer but when I got to start sending info to and from the TNC it
zonks my computer and makes it reboot. Is there anything I can do to
relieve this?

First, you should contact tech support for the USB dongle. Or at least
browse their web site for help.

Next, have you gone to the tech support web site of your laptop maker to
see if they have a newer USB driver for your motherboard, updated BIOS,
or any clue why it's dumping the OS? What you describe is a fairly
drastic way for the OS to tell you there's a conflict somewhere and the
current drivers aren't behaving well. Have any other USB devices ever
behaved this way on this laptop?

You can also try and identify your USB chipset and go to www.usbman.com
to see if anyone has reported a bug or fix.

I'm an actual registered owner of it. This APRS application uses Microsoft MapPoint as it's display engine; indeed APRSpoint is actually an add-in for MapPoint; that is you MUST have MapPoint 2002 to use it. You have zoomable scrollable street-level detail similar to APRSplus/StreetAtlas or WinAPRS/Precision Mapping.

MapPoint DOES provide street-level detail in Canada as well as the United States AND major roads (but not city streets) in Mexico. MapPoint can be switched to a physical display mode where the mountains show in a raised relief look. The soft earth tone color scheme of MapPoint is harder to see on a laptop in a car compared to Street Atlas. APRSpoint doesn't project the standard APRS icons on it's maps; rather it uses the extensive but different (and in my opinion not contrasty enough; i.e. not bright primary colors) Microsoft-provided "pushpin" icon set. It DOES use the standard MS pushpin function where you can right-click on an icon and expand a callout with all the detail for the particular station.

APRSpoint has the usual dual TNC/Internet connectivity and can do the Igate thing. It supports the mixed TNC data/local GPS data stream that the Kenwood D7/D700s produce.

The user interface is deceptively simple; almost too obvious! The main map display looks very "Microsoft-ish" with a Windows-File-Explorer-style tree in the left pane of the screen presenting sorted lists of MOBILE, FIXED, WX, etc which you expand by clicking on the little plus signs. Right clicking on a call sign calls up the last posit, status message, etc.

If you use MS Outlook, it's APRS messaging functions will look very familiar; it creates the same kind of hierarchic IN/OUT/SENT/TRASH tree using the same icons, and the "Send Message" and "Send Object" screens look an awful lot like Outlook's "Send Email" dialogs.

Unlike other APRS apps, APRSpoint WILL NOT plot track lines showing a mobile's course of travel (or dead reckoning lines, Bob!) ; only the last reported location. The beaconing is not (yet) smart; it transmits at fixed intervals and doesn't do compressed or MIc-E reports.

You can run MapPoint independent of the APRS application, but it's built-in GPS handler is really clunky compared to Delorme's (or even Microsoft's predecessor Automap product). Instead of a "breadcrumb" trail of green arrows showing your course of travel, all you get is one big fat round circle with an icon of a car in it, with NO indication which way you are going.

If you have a Pocket PC device (i.e. HP Journada, Compaq Ipaq, etc) one unexpected freebie bonus of owning MapPoint is that you can export pieces of the MapPoint map anywhere in it's coverage area, in chunks up to about 50 miles across, WITH FULL STREET DETAIL AND INDEXING to these pocket devices. Now if only APRS-CE could work with these excellent maps .....

Rendered body type: text/plain

```
Some other stuff I forgot to mention....

Some background:

Microsoft MapPoint is a member of the Microsoft Office family. It is capable
of displaying almost any kind of data tagged with lat/long information or
street address fields.  It is positioned midway between consumer map
applications like Street Atlas or RandMcNally Street Finder on the one hand
and "serious" GIS application like ArcView or MapInfo on the other.
     As a mid-level "personal GIS" package it is similar to Delorme's "X-Map"
product and is intended, for example, for a salesman to plot his customer
list from an Excel spread sheet or Outlook Address Book.  You can plot one
layer of data but not multiple layers like MapInfo.  Like Word and Excel, it
is designed so that outside developers can create plug-ins and add-ons that
extend it's function. APRSpoint actually merges itself into the MapPoint user
interface when started.  This is somewhat the same effect you get when a
document with elaborate macros,  customized toolbars and controls is opened
in Word or Excel.

MapPoint comes in two versions: One covers all of North America and the other
Western Europe.  Both have full zoomable street-level-resolution display.
Additionally, they both surround their their respective areas of detail with
a simple WORLD map that shows national borders and an amazing number of
cities as single point objects (but no roads, rivers, etc).  The implication
of this is that APRSpoint can actually show the (approximate) location of
non-US stations that come in on the APRServe Internet feed (or boats at sea!)

MapPoint is relatively expensive (compared to Street Atlas or Precision
Mapping) but you can actually get double APRS use out of it. The same
MapPoint 2002  package that supports APRSpoint as an add-in,  can also be
used with UI-View!

UI-View supports MapPoint as an external application in a manner similar to
the APRSplus/Street Atlas or WinAPRS/Precison Mapping duos.  A freebie
downloadable "middleware" component, UI-Point, available on the UI-View
website ties UI-View32 (wont' work with UI-View 16) and MapPoint together.

There was a long thread on the UI-View mailing list about UI-Point.
Short story: some dumbo at Microsoft (not one of their lawyers, all very suspicious) sent Roger Barker (the author of the software) an email

telling him that UI-Point violates the EULA (end-user license agreement) of Mappoint. Very weird, because no parts of Mappoint are distributed with UI-Point, and UI-Point is beneficial to Microsoft because it encourages people to buy Mappoint!

If you want to know more about it, go to the "ui-view" mailinglist at yahoogroups.com and look for the thread "I just don't believe it".

I just want to avoid APRSpoint to go the same way, where a good software effort is being shot down because of the idiocy of Microsoft.

I found the USB > Serial drivers available for my XCT (?) adpater do the
same thing in Win XP. They are not ready for prime time. The same device
with Win9x drivers work fine on all 3 98se machines I have, but the XP
driver is very buggy for it and so I can't use it yet. Hopefully better
drivers will come out soon.

My adapters came from purple computing. They are othewise very good.

With AutoRefresh Maps turned on, after a refresh, much of the time, clicking on a station Icon will not "tag" the station and nothing can be done with the mouse. Double clicking with the mouse does not bring up the station detail.

This may not happen all the time, but it happens frequently. Turning off Auto Refresh solves the problem, at least for a while.

As I recall (and this was a long time ago), this problem has been present off and on for many versions.

One improvement so far:

I have been connected to the internet for 11 hours and not had a crash. I'll be keeping an eye on it.

Regarding MapPoint, Mickael has an agreement with Microsoft to distribute MapPoint with APRSPoint, but
there is a cost. You pay for the product so Microsoft is paid.

On Tue, 4 Jun 2002 06:17:02 -0400 "Ramon F. Kolb" <ramon@ieee.org> wrote:

There was a long thread on the UI-View mailing list about UI-Point.
Short story: some dumbo at Microsoft (not one of their lawyers, all very
suspicious) sent Roger Barker (the author of the software) an email
telling him that UI-Point violates the EULA (end-user license agreement)
of Mappoint. Very weird, because no parts of Mappoint are distributed
with UI-Point, and UI-Point is beneficial to Microsoft because it
encourages people to buy Mappoint!

If you want to know more about it, go to the "ui-view" mailinglist at
yahoogroups.com and look for the thread "I just don't believe it".

I just want to avoid APRSpoint to go the same way, where a good software
effort is being shot down because of the idiocy of Microsoft.

I'm an actual registered owner of it.   This APRS application uses
Microsoft
MapPoint as it's display engine; indeed APRSpoint is actually an add-in
for
MapPoint; that is you MUST have MapPoint 2002 to use it. You have
zoomable
scrollable street-level detail similar to APRSplus/StreetAtlas or
WinAPRS/Precision Mapping.

MapPoint DOES provide street-level detail in Canada as well as the
United
States AND major roads (but not city streets) in Mexico. MapPoint can
be
switched to a physical display mode where the mountains show in a raised

relief look. The soft earth tone color scheme of MapPoint is harder to
see
on a laptop in a car compared to Street Atlas.   APRSpoint doesn't
project
the standard APRS icons on it's maps; rather it uses the extensive but
different (and in my opinion not contrasty enough; i.e. not bright
primary
colors) Microsoft-provided "pushpin" icon set. It DOES use the standard
MS
pushpin function where you can right-click on an icon and expand a
callout
with all the detail for the particular station.

APRSpoint has the usual dual TNC/Internet connectivity and can do the

Igate
thing. It supports the mixed TNC data/local GPS data stream that the Kenwood
D7/D700s produce.
The user interface is deceptively simple; almost too obvious! The main
map display looks very "Microsoft-ish" with a
Windows-File-Explorer-style
tree in the left pane of the screen presenting sorted lists of MOBILE, FIXED,
WX, etc which you expand by clicking on the little plus signs. Right
clicking on a call sign calls up the last posit, status message, etc.
If you use MS Outlook, it's APRS messaging functions will look very
familiar; it creates the same kind of hierarchic IN/OUT/SENT/TRASH tree using
the same icons, and the "Send Message" and "Send Object" screens look an
awful lot like Outlook's "Send Email" dialogs.

Unlike other APRS apps, APRSpoint WILL NOT plot track lines showing a
mobile's course of travel (or dead reckoning lines, Bob!) ; only the last
reported location. The beaconing is not (yet) smart; it transmits at fixed
intervals and doesn't do compressed or MIc-E reports.

You can run MapPoint independent of the APRS application, but it's built-in
GPS handler is really clunky compared to Delorme's (or even Microsoft's
predecessor Automap product). Instead of a "breadcrumb" trail of green arrows
showing your course of travel, all you get is one big fat round circle with
an icon of a car in it, with NO indication which way you are going.

If you have a Pocket PC device (i.e. HP Journada, Compaq Ipaq, etc) one
unexpected freebie bonus of owning MapPoint is that you can export pieces of
the MapPoint map anywhere in it's coverage area, in chunks up to about 50
miles across, WITH FULL STREET DETAIL AND INDEXING to these pocket devices.
Now if only APRS-CE could work with these excellent maps .....

What trademark infringement? APRS is not even mentioned on the web page.
And simply using the term APRS is not always a trademark violation.

Rendered body type: text/plain

All,
AHubIN is back up for a testing period of two days. I have had numerous
hardware, and software problems with my new two-way satellite internet
connection, and I need to test the stability of the system. I strongly
encourage everybody to connect for awhile, and see how it works for you. I
also request that if you do try it, if possible, that you drop me an e-mail,
and let me know how it was working. If you experience any problems, also
drop me an e-mail. Right now only AHubIN is available, I will turn AHubSAT
back on after I see how stable this new system is going to be. To connect,
use the url of ahubin.d2g.com. Ports 2023 (worldwide feed), and 14579
(regional feed), are available at this moment. For more information, visit
http://www.qsl.net/kb9uqq/ahub.htm.

Rendered body type: text/plain

Greetings,

For those people running JNOSaprs or TNOSaprs at level 1.12.1
or higher, I have another BETA patch, release 1.12.2y. Those of
you that are running older versions of NOSaprs are encouraged to
upgrade to at least 1.12.1, which is the latest official release.

Website is below :

http://www.qsl.net/ve4klm/packet/aprss.html

Please rememember to read the upgrade and history release notes,
which contain ALOT of additional and very important information,
including changes and additions to the NOSaprs command set.

Best regards,

Maiko Langelaar / VE4KLM

I was wondering what port on the back of a MAC do I use to connect a KPC-2
to? I am trying to get an APRS station setup at my Mom's (KCØMEO) School.
Also if there are any teachers on this list could they give some ideas on
what all APRS can be used for. Right now the current plan is to get weather
data from other locations in NE Kansas. Thanks for your help on this.

```
Use either the serial port or the printer port, make sure that
the serial tool is loaded in the extensions folder on boot-up

You can select either port in the MACAPRS pull Down Menu

Windows 2000 forever!  The Purple ports work just fine with it.  In general,
I have found that Win 2K is much more friendly to older drivers and apps than
XP.

BTW, did you know that Win 2K is actually Windows NT 5.0 ,   and that XP is
actually Windows NT 5.1 ?  Not that much difference except.....    the driver
compatibility issues,    the Java-challenged browser (IE 6.0) that brow-beats
you into signing up for Chairman Bill's PassPort service that sells your
email address,     and the infernal "product activation wizard".

Rendered body type: text/plain

Hi all!

I have been running an Igate here in the Minneapolis - St. Paul MN metro area for a number of months with good results in getting weather and other APRS data into the APRS IS. However, in the past week, I have found long spans of time where this data is not available via findu although I show that I am connected to the IS via (usually) AHUB central or Ahub East (port 14579).

I'm running UI-View32, latest updates, registered, etc. using a DSL connection with static IP. I have been running this configuration for several months without any but the occasional network lapse. This seems much more frequent and repeated than in the past.

Any ideas? Comments?

w0led@arrl.net

```

That's from the Xastir log, and here's the track with timestamps:

```
Packets received: 20     Last Heard: 06/04/2002 12:31:15
Heard last via Internet on device 0, and has moved
Data path: APRS,RELAY,WIDE,WIDE3-3
Comments:   TH-D7 Mic-E Emergency TEST MAYDAY TEST
Current Power Gain: default (9W @ 20ft HAAT, 3dB omni, range 6.2mi)
Altitude: 4314ft Course: 1680 Speed: 191.0 mph
Distance from my station: 39.8 miles  Bearing from my station: 29.90
Last Position: 06/04  12:31   43 35.620N  075 46.589W  4314ft  191mph 1680
                06/04  12:14   43 40.600N  075 47.970W  4659ft  168mph 1710
                06/04  12:11   43 43.980N  075 48.719W  4678ft  169mph 1700
                06/04  12:11   43 49.000N  075 50.080W  4514ft  174mph 1670
             +  06/04  12:06   43 57.490N  075 52.760W  4678ft  170mph 1710
```

I have a 5/8 wave at about 30' AGL with a good view to the north. I don't know if they turned on the position beacon when they were already at altitude, or that was just the first time I was able to hear them. The first packet I copied was the first one that made it to findu, so that might have been the beginning of the test. BTW, an incorrect email address was circulating for position reports; the real one is apparently peaprs@rl.af.mil.

Clay,
It seems that AHubCentral is no longer operating. I also noticed that AHubEast seems to be down at present. Try http://www.ahubswe.net/aprs_stat.asp to see what servers or hubs are currently active.

To: TAPR APRS Special Interest Group
Subject: [aprssig] Re: APRSpoint [ Sort of a first impressions/review ]

There was a long thread on the UI-View mailing list about UI-Point.
Short story: some dumbo at Microsoft (not one of their lawyers, all very
suspicious) sent Roger Barker (the author of the software) an email
telling him that UI-Point violates the EULA (end-user license agreement)
of Mappoint. Very weird, because no parts of Mappoint are distributed
with UI-Point, and UI-Point is beneficial to Microsoft because it
encourages people to buy Mappoint!

If you want to know more about it, go to the "ui-view" mailinglist at
yahoogroups.com and look for the thread "I just don't believe it".

I just want to avoid APRSpoint to go the same way, where a good software
effort is being shot down because of the idiocy of Microsoft.

```

> Anybody know anything about APRSpoint ?
>
> I saw it mentioned in the last QST:
>
> http://www.aprspoint.com

I'm an actual registered owner of it. This APRS application uses Microsoft MapPoint as it's display engine; indeed APRSpoint is actually an add-in for MapPoint; that is you MUST have MapPoint 2002 to use it. You have zoomable scrollable street-level detail similar to APRSplus/StreetAtlas or WinAPRS/Precision Mapping.

MapPoint DOES provide street-level detail in Canada as well as the United States AND major roads (but not city streets) in Mexico. MapPoint can be switched to a physical display mode where the mountains show in a raised

relief look. The soft earth tone color scheme of MapPoint is harder to see on a laptop in a car compared to Street Atlas. APRSpoint doesn't project the standard APRS icons on it's maps; rather it uses the extensive but different (and in my opinion not contrasty enough; i.e. not bright primary colors) Microsoft-provided "pushpin" icon set. It DOES use the standard MS pushpin function where you can right-click on an icon and expand a callout with all the detail for the particular station.

APRSpoint has the usual dual TNC/Internet connectivity and can do the Igate thing. It supports the mixed TNC data/local GPS data stream that the Kenwood D7/D700s produce.

The user interface is deceptively simple; almost too obvious! The main map display looks very "Microsoft-ish" with a Windows-File-Explorer-style tree in the left pane of the screen presenting sorted lists of MOBILE, FIXED, WX, etc which you expand by clicking on the little plus signs. Right clicking on a call sign calls up the last posit, status message, etc.

If you use MS Outlook, it's APRS messaging functions will look very familiar; it creates the same kind of hierarchic IN/OUT/SENT/TRASH tree using the same icons, and the "Send Message" and "Send Object" screens look an awful lot like Outlook's "Send Email" dialogs.

Unlike other APRS apps, APRSpoint WILL NOT plot track lines showing a mobile's course of travel (or dead reckoning lines, Bob!) ; only the last reported location. The beaconing is not (yet) smart; it transmits at fixed intervals and doesn't do compressed or MIc-E reports.

You can run MapPoint independent of the APRS application, but it's built-in GPS handler is really clunky compared to Delorme's (or even Microsoft's predecessor Automap product). Instead of a "breadcrumb" trail of green arrows showing your course of travel, all you get is one big fat round circle with an icon of a car in it, with NO indication which way you are going.

If you have a Pocket PC device (i.e. HP Journada, Compaq Ipaq, etc) one unexpected freebie bonus of owning MapPoint is that you can export pieces of the MapPoint map anywhere in it's coverage area, in chunks up to about 50 miles across, WITH FULL STREET DETAIL AND INDEXING to these pocket devices.
Now if only APRS-CE could work with these excellent maps .....

129. [aprssig] RE: PEAPRS Test

From: "Brian B. Riley \(N1BQ\) ListAcct" <n1bq_list@wulfden.org>
Date: Tue, 4 Jun 2002 16:50:21 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83173-2002.06.04-16.26.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I received it at 1612z at my location, 16 miles east of Burlington, VT.
Unfortunately its entry in the list on my D700 had scrolled off and I
cleared the EMERGENCY screen display before I recorded its location.

To: TAPR APRS Special Interest Group
Subject: [aprssig] Re: APRSpoint [ Sort of a first impressions/review ]

There was a long thread on the UI-View mailing list about UI-Point.
Short story: some dumbo at Microsoft (not one of their lawyers, all very
suspicious) sent Roger Barker (the author of the software) an email
telling him that UI-Point violates the EULA (end-user license agreement)
of Mappoint. Very weird, because no parts of Mappoint are distributed
with UI-Point, and UI-Point is beneficial to Microsoft because it
encourages people to buy Mappoint!

If you want to know more about it, go to the "ui-view" mailinglist at
yahoogroups.com and look for the thread "I just don't believe it".

I just want to avoid APRSpoint to go the same way, where a good software
effort is being shot down because of the idiocy of Microsoft.

I'm an actual registered owner of it.   This APRS application uses Microsoft MapPoint as it's display engine; indeed APRSpoint is actually an add-in for MapPoint; that is you MUST have MapPoint 2002 to use it. You have zoomable scrollable street-level detail similar to APRSplus/StreetAtlas or WinAPRS/Precision Mapping.

MapPoint DOES provide street-level detail in Canada as well as the United States AND major roads (but not city streets) in Mexico. MapPoint can be switched to a physical display mode where the mountains show in a raised relief look. The soft earth tone color scheme of MapPoint is harder to see on a laptop in a car compared to Street Atlas.   APRSpoint doesn't project the standard APRS icons on it's maps; rather it uses the extensive but different (and in my opinion not contrasty enough; i.e. not bright primary colors) Microsoft-provided "pushpin" icon set. It DOES use the standard MS pushpin function where you can right-click on an icon and expand a callout with all the detail for the particular station.

APRSpoint has the usual dual TNC/Internet connectivity and can do the Igate thing. It supports the mixed TNC data/local GPS data stream that the Kenwood D7/D700s produce.

The user interface is deceptively simple; almost too obvious! The main map display looks very "Microsoft-ish" with a Windows-File-Explorer-style tree in the left pane of the screen presenting sorted lists of MOBILE, FIXED, WX, etc which you expand by clicking on the little plus signs. Right clicking on a call sign calls up the last posit, status message, etc.

If you use MS Outlook, it's APRS messaging functions will look very familiar; it creates the same kind of hierarchic IN/OUT/SENT/TRASH tree using the same icons, and the "Send Message" and "Send Object" screens look an awful lot like Outlook's "Send Email" dialogs.

Unlike other APRS apps, APRSpoint WILL NOT plot track lines showing a mobile's course of travel (or dead reckoning lines, Bob!) ; only the last reported location. The beaconing is not (yet) smart; it transmits at fixed intervals and doesn't do compressed or MIc-E reports.

You can run MapPoint independent of the APRS application, but it's built-in GPS handler is really clunky compared to Delorme's (or even Microsoft's predecessor Automap product). Instead of a "breadcrumb" trail of green arrows showing your course of travel, all you get is one big fat round circle with an icon of a car in it, with NO indication which way you are going.

If you have a Pocket PC device (i.e. HP Journada, Compaq Ipaq, etc) one unexpected freebie bonus of owning MapPoint is that you can export pieces of the MapPoint map anywhere in it's coverage area, in chunks up to about 50 miles across, WITH FULL STREET DETAIL AND INDEXING to these pocket devices.
Now if only APRS-CE could work with these excellent maps .....

The use of "TinyTrak" is a trademark infringement.

Stealing the firmware is another infringement.

Clearly a cause for legal action. Since it is international, I think the State Department may be of some help. Byon, start by calling your congressman and senators.

Duffy - WB8NUT

139. [aprssig] New Feature for All APRS Client Software

From: "hasan schiers" <schiers@netins.net>
Date: Wed, 5 Jun 2002 08:43:12 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83303-2002.06.05-09.20.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Rick Edwards raised an interesting question about why we see garbaged wx packets on the D7 and D700. They are, of course, the result of "raw" wx packets being transmitted by remote stand alone weather stations, like the Peet Bros. They cannot be decoded by the D7 or D700 and result in a ?? being placed on the display. This is a well known problem.

Bob, WB4APR included a "decode/translate and retransmit" feature into aprsDATA, that solves the problem, but not in a very efficient manner. New software, new hardware. Silly, but functional.

Now...here's an idea. All the APRS client software (APRS+SA, WinAPRS, UIview, pocketAPRS, Xastir, aprsCE, etc.) should have the capability to translate and retransmit just like aprsDATA does. Then the problem would be solved. (Although we would have to watch out for network congestion.) We wouldn't want ten local stations retransmitting the same translated raw weather packet, just like we don't want ten local stations all running aprsDATA. We only need as many of them as are required for "local" coverage in each area. If the client software had this capability and a "switch" for ON/OFF, that would allow us to take care of the problem once and for all, WITHOUT having to add new computers, tnc's and radios.

Is there some obvious reason I have missed why this feature has not been incorporated into ANY of the software listed above? It would fill in a hole without having to spend more money. Surely it couldn't be that processor or memory intensive? I understand that it might just be a matter of priorities in that the authors have bigger fish to fry.

In any case, I hope that Brian and the Bros. Sproul (representing by far the greatest user base) will consider adding this feature to their APRS software. There are a LOT of "stand alone" remote weather stations out there...and driving around staring at "??" is not particularly functional. Admittedly, this is no where near as important as receiving wx warnings while driving around...but that already works great as it is currently implemented.

Feedback? 73

Good Morning,

I see in the APRS spec that source and destination addresses are limited to 7 bytes, but if you operate in some other countries you need to add a prefix to your callsign (example in Kyrgyzstan I would become EX/VE7OLF), bringing the address up to 9 bytes. Is the APRS system hard-coded to prevent using a longer address, will PCSAT digipeat such an address, or any of the windows software gate it properly?

73, Scott

This has been discussed here before. For operations in the US, you should include the longer, full callsign within a status packet or as data in other packets where possible. In non-US countries, you need to follow their requirements for identification.

The 7 byte limitation is an artifact of the implementation of AX.25 and there is no easy way to circumvent that. So, you have to identify using an alternate means based on the requirements of the country you are in.

AX-25 is limited to 6 characters and the SSID...it is not an APRS
limitation per se, though many APRS programs use the same limits.

Coordinating between different translating clients would be difficult
if not impossible, and channel congestion would rise greatly.
Furthermore, the data in the Peet brothers weather packet does not
match APRS fields, for example in the U2K logger mode the wind is
reported as instantaneous rather than average or sustained, and
rainfall is cumulative rather than 1hr/24hr/midnight, so a true
conversion is not possible at all. At least nw we know when data is in
Peet format what it represents, a simple mapping to fields that don't
match would make it hard to figure out what the data actually
represented.

Give that the Peet formats are not exactly the data APRS needs, and
the Kenwoods do not read them, a better solution is to place a
computer or microcontroller between the weather station and TNC to do
the conversion. A long time ago I did such a beast on a 16F84 to solve
a different problem, I needed the Peet in complete record mode to
support my weather pictures, but I wanted to send the weather data in
APRS format. With today's Pics with built-in serial ports and more
memory it would be a piece of cake.

But since there only needs to be one APRSdata in each major
area, if there isn't one, then put one there. If there is one,
then enable the WX conversion. I guess if it was just a click of
a mouse included in every copy of every client program, then
human nature wouild assure us that most of the time we would have
too many people with this feature enabled and we would be wasting
a lot of time policing the network.

ANyway, just a thought. It does DOUBLE the weather load on a given
channel, so no matter who does it, it needs to be done with caution..

Rendered body type: text/plain

Thanks Bob,

It would double the weather load from that specific stand-alone.

We have 3 in "range". If we make it too convenient it might get abused. I
suggested it be included in the client software but defaulted to off.

We must be spoiled out here in the sticks. We don't have nearly the problem
coordinating our efforts that seems to pop up all the time.

You may have hit on the real issue, if you make the solution too accessible,
it will result in mindless use of the feature and clog the network. I had
not considered that as a real problem, but it probably is, or at least would
be in some areas.

Additonally, from Steve's comments, it appears that the entire concept may
be flawed in that the wx data being reported by the Peets is wrong, (at
least in some minor way). I'm waiting to hear the results of that one. It
may be that the rain and wind are wrong and everything else is right, but
that still makes for "wrong data". My guess is we have chosen to live with
this limited "wrongness", and if that is true, then that part of the
discussion is a bit of a red-herring.

The only real issue that remains then, is congestion, which "ought" to be
able to be managed locally, but neither you nor Steve seem all that
optimistic about that taking place <grin>.

It's as if the very solution I was looking for becomes the new problem. It
is by design that you have to have the will and interest to put up a new

machine, new software, new radio, and new antenna. Otherwise everyone might
do it. There is a certain appeal to this line of thinking, but something
about it bothers me....I'm just not sure what it is. <vbg>

73 and thanks

I do not know anything about aprsDATA, but since it only has what it
gets on the air to work with, say one instantaneous reading every 5
minutes, there is no way it can come up with an average wind speed.

It would be possible for the program to track the rainfall, and
produce the three APRS fields of data, I cannot say if it does so or

simply does a simple conversion. Looking at the data should tell you
this quickly. I'm guessing this data is transmitted in third party
format (data payload starts the "}" and a TNC style packet follows),
right? If so the converted data will not appear on findU so I can't
answer the question from here.

>Do home weather stations suffer the same problem? It seems like they
>would. The raw data string coming from the Peet is decoded and
>formatted into aprs compatible strings and then transmitted as a
>weather packet....isn't that right?
>
Different situation, the APRS software has access to every report, I
think it is two seconds in the peet data logger format, so it is quite
possible to calculate an average wind speed. What each program
actually does is a question each individual author would need to
answer for themselves.

Most programs that report rainfall do seem to do the calculation and
report the correct values, though I can say that MacAPRS still has
problems with the Peet Complete Record Mode and rainfall since
midnight. It does get the 1 hour correct.

>If that's true, then all wx reports from Peet's suffer the same
>problem depending on the mode the Peet is set to, and it has nothing
>to do with stand-alone vs. home connected to aprs client.
>
The problem would be limited to weather stations that transmit the raw
data from the weather stations. Peet is the only manufacturer that
this is possible with, but stations connected to a client program
which transmits data in APRS format would not be affected.

>I guess I'm really confused. The raw packet that contains the info
>from the Peet is nothing more than the raw ascii string (in hex)
>coming from the Peet...it is not reformatted, it is a pass through.
>If the raw information is wrong, then the home station, stand-alone
>or translation program can't possibly be right.
>
>Is this correct? Our current generation of aprs clients with wx
>stations attached are producing erroneous data.

Completely incorrect conclusion. This difference is aprsDATA is only
getting one data point ever 5 minutes, while an APRS client program is
connected continously and getting each data point, so it can generate
a true average (at least within 2 second granularity), and can track
the gust. Certainly one could write a bad client program that simply
took the instant wind speed and threw it into the packet, but that
would violate the APRS spec. Again, something each APRS client author
would need to answer.

>In our particular area I think we see 3 different stand-alone wx
>stations transmitting. aprsDATA translates them and retransmits. Is
>this a significant load?

No, but if every WinAPRS user did it would. Coordination of such
things is difficult, and again, any wind conversion is going to be
flawed, but because it in an APRS style packet there is no way to tell
whether it is accurate or not. Best is to get it right at the source.

Then the next step would be to implement a protocol in all APRS programs
that implement this translation such that if a particular program heard
this conversion, it wouldn't bother. Don't make it a manual option - have
the programs absolutely refuse to rebroadcast the converted packets if
somebody else is already doing the conversion.

One solution would be to run APRSdata or any other lookalike and convert
all WX data to a single consistent APRSwx foramt and put that out on a
different frequency. AND up the reporting rate substantially. Then you
could just tune to that frequency and in about 40 seconds get a complete
dump of the 40 nearest WX stations right there on the front of your
radio...

Thanks Steve, that clears it up. There is no practical solution for
aprsDATA.

It will not have accurate indications of wind .

If, however, the only interest is cleaning up the stand-alone remotes so they can be read on the D7/700's, then it's either aprsDATA with built in limitations on wind/rain or the client software doing the same thing with the same limitations.

I see how the integration or summary period could be properly done by the home weather station, so the only problem is with stand-alone remotes.

Thanks for taking the time to explain it. 73

p.s. thanks also to Bob for his input.

Rendered body type: text/plain

Dumb question.   I can't remember, and on a quick scan through the KPC-3 book, I could not find the command that sets a connecction timeout for a TNC.

Maybe I am remembering only a command for the PBBS...

I want a connection to the TNC to timeout after a certain time... if someone connects and then never disconnects....

Maybe I am thinking of the AX25v2-L2 which will send back and forth check packets and will disconnect if there is no response to a CHECK packet. But still if the connectee walks away and his TNC remains with his radio on, that will never timeout either..

What have I forgotten?
 Bob

CHECK n   (n = 0 - 255)

default = 0

This "timeout" command is used to prevent a "hang-up in a
connected mode when a link failure occurs as a result of
conditions beyond control of the connected stations.... The
value entered for "n" is the number of ten second intervals
to wait during "no activity" before making a periodic check
(poll) to determine that a connection state still exists.

If n equals 0, this "timeout" function is disabled. While
using Version 1 (AX25l2vV2 OFF), a check timeout will
initiate a disconnect.

What you need to do to get PM3.0 & 3.5 to work with 2.6.1 First go back to
2.5.1 and create several PM windows then save the window configure. Then go
back to 2.6.1 and they will open up. You just can't open up new windows.
Also don't install the PM5.0 bat file. At least it works for me here.

It works. Thanks Jimmy. I only opened one PM 3.0 window in WinAPRS 2.5.1
and then File,Save Window Config to the WinAPRS folder. Then closed
WinAPRS and installed 2.6.1 update. Then, after starting WinAPRS 2.6.1,
there was (a square) PM3.0 window working FB!

While it may be possible to display the zoomed out 3.x maps with 2.6.x, i
am pretty sure that you will not be able to zoom in and see any detail. I
had that problem when I first installed WinAprs 2.6.x Not sure that any of
the PMap search functions will still work. In any case, WinAprs 2.6.x was
designed for use with PMap 5.0. However, based on other posts to the sig,
3.x maps seems to work ok for some. Your mileage may vary.

If you have any PMap registration difficulty with WinAprs using the PMAP
5.0 maps, run Traveler.Exe (should be in the PMap50 directory) and register
it when the registration dialog appears. WinAprs requires that the maps be
registered before it will use them AFAIK.

The registration dialog allows you to register over the Internet, over the
phone (800 number) or register later.

If you elect to register over the Internet, you will have to use your
browser to go to http://www.RegisterMyApp.com to register. You will be
asked to supply your product code. The product code is found at the top of
the PMap registration display window and it should start with 1039- Once
you register at RegisterMyApp you will be given a serial number. This
serial number must be entered into the PMap 5.0 registration window. Write
the number down somewhere (on the printed material in the PMap 5.0 jewel
case for example) in case you need to re-install it.

Note that it may be easier to register by phone. The number is
1-800-257-9244. Have the product code (1039-xxxx) ready to give to the
operator.

You must also run PMap5.bat (comes with WinAprs 2.6.x) or something similar
to register the OCX included in the WinAPRS distribution. Once you do
this WinAprs 2.6.x should work with the PMap.50 maps.

<snip>

I'm finding PM 3.0 does indeed work as well as it did in WinAPRS 2.5.1,
using the setup technique already mentioned.  Using WinAPRS 2.6.1, the PM
3.0 detail and other functions (including searches) work exactly as they did
in 2.5.1.  The only difference is that the max window size is square, rather
than rectangular!
FWIW.

ARLB031 Second Precision Emergency Automated Position Reporting
system test set

ZCZC AG31
QST de W1AW
ARRL Bulletin 31  ARLB031
>From ARRL Headquarters
Newington CT  June 5, 2002
To all radio amateurs

SB QST ARL ARLB031
ARLB031 Second Precision Emergency Automated Position Reporting
system test set

The Air Force Research Lab, Rome (New York) Research Site, is
conducting an experiment using Amateur Radio operators as an
auxiliary line of defense against aircraft disasters. The Precision
Emergency Automated Position Reporting System (PEAPRS) test is being
carried out in conjunction with the annual Team Patriot exercise.
The ARRL is co-sponsoring the test.

The first of two aircraft flights this week occurred June 4, and a
second will take place on or before June 8. The aircraft will
transmit an APRS distress message on 144.39 MHz, using the call sign
WA2ZXS. Amateurs receiving the message are requested to e-mail
peaprs@rl.af.mil detailing the time, characteristics of the message
received and the method they used for reception--whether direct, via
digipeater, via wide relay, the Internet or other means.

Those lacking e-mail capability may participate by calling their
observation info into the PEAPRS Command Center at 315-330-7444.

The exercise will attempt to measure the timeliness and accuracy of
the amateur reports received. Participating amateurs will qualify
for a special certificate from ARRL recognizing their efforts.

```
Hi,
```

A while back I bought a used Oncore GPS unit and did not get around to
playing with it. WHen I did connect it, the location it sent was off by
several hundred miles. I sent a message via the sig and received several
messages suggesting that I let it run for a day so it could reset. I have
let it run for several days and while I cannot be sure that the location it
is transmitting is the same, it is way off from 4130.55 07540.70 that it
should be. THis is what it is sending every ten seconds
$GPRMC,,V,4152.9000,N,08808.7667,W,,,,2.0,W*60.

Any suggestions on how I can get the system to reset and see the correct
location?

Thanks
Bob

the PMap search functions will still work. In any case, WinAprs 2.6.x was
designed for use with PMap 5.0. However, based on other posts to the sig,
3.x maps seems to work ok for some. Your mileage may vary.

If you have any PMap registration difficulty with WinAprs using the PMAP
5.0 maps, run Traveler.Exe (should be in the PMap50 directory) and register
it when the registration dialog appears. WinAprs requires that the maps be
registered before it will use them AFAIK.

The registration dialog allows you to register over the Internet, over the
phone (800 number) or register later.

If you elect to register over the Internet, you will have to use your
browser to go to http://www.RegisterMyApp.com to register. You will be
asked to supply your product code. The product code is found at the top of
the PMap registration display window and it should start with 1039- Once
you register at RegisterMyApp you will be given a serial number. This
serial number must be entered into the PMap 5.0 registration window. Write
the number down somewhere (on the printed material in the PMap 5.0 jewel
case for example) in case you need to re-install it.

Note that it may be easier to register by phone. The number is
1-800-257-9244. Have the product code (1039-xxxx) ready to give to the
operator.

You must also run PMap5.bat (comes with WinAprs 2.6.x) or something similar
to register the OCX included in the WinAPRS distribution. Once you do
this WinAprs 2.6.x should work with the PMap.50 maps.

Bob,

Since you are receiving NMEA strings, I assume you have attached to the GPS
with WinCore or SynTac to configure the unit.  How many satellites is the
gps seeing?  If you are running the unit inside a building, you many never
have tracked enough satellites to get a lock or even build an
almanac.  I've seen some pretty far off coordinates if the almanac hasn't
been built.

Both WinCore and Syntac have diagnositic messages, that might give you a
clue to what else might be causing the problem.

```
I've been reading tonight about RFID tags made by texas instruments.  Reason
being that I have just ordered a speedpass and was wondering what else I
could use the speedpass key fob for.  Anyway, upon reading their site, I
found http://www.ti.com/tiris/docs/solutions/sports.shtml which shows a RF
ID tag attached to someone's shoe strings.  This got me thinking.  The
system could be used to track people in an EOC and the data retransmitted
onto aprs via the proximity digi method we used with indoor trackers in
Dayton.  The antennas seem to be a bit pricey, but the transponders are dirt
cheap at about $4 each.  The chip to demodulate the data is $6, plus a $70
antenna (bummer).  For what it's worth, these systems operate on 134.2khz
(look out LOWfers).  They also mention that the transponders are used in the
Boston marathon, which brings all sorts of ideas for the MS150 bike races to
mind.....

just thinking....

Wes

Wes:

There are also some good application notes on the MicroChip web site
regarding ID tags similar to what you speak of.

Good idea you had.

If you are amendable to writing some code, check out the Dallas
Semi 'One-Wire' temperature sensors. Neat devices. And pretty
accurate.

The issue would be that you would have to interface with the 'One-Wire'
interface. But a PIC or something like a Z8+ would be easy to do.

Mike

182. [aprssig] Cheap Temp monitor

From: "Craig Brunson" <Brunson1@gte.net>
Date: Thu, 6 Jun 2002 07:12:06 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83513-2002.06.06-09.48.21--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Using the circuit below:

```
          thermistor
5v ---/\/\/\-----,
                   v           4.7k
         10k    /\/\/\/\-*-/\/\/\/\---com
                          |___ to analog input of  KPC3+
```

Get a Radio Shack Thermistor #271-110A for $1.99.
Use the 5v source in the KPC3 for a reference voltage.
Make a voltage divider from a 10k trimpot # 271-282, and a 4.7k resistor.

This gives you a voltage from 0 - 5v, which translates to a count of 0 to 255.
You can 'calibrate' it using ice @32 degrees & boiling water @ ~212 degrees
(& freeze spray for colder temps)
Make a chart of count vs. temperature to 'read' the temperature over the air.

Also a simple 2 resistor divider makes a 0-25v voltage monitor.

The gctelecomar.com web page does not mention TinyTrak.

> Stealing the firmware is another infringement.

Yes although the license agreement on the byonics.com web site
is not particularly strong.

Most APRS software has the capability to translate Mic-E packets to
standard APRS format eg aprsdigi (the linux one) can do it on
packets it repeats, aprsd can do it on packets it sends to the
Internet etc.

Now we're at the point that that translation is undesirable and
we want everyone to turn it off. For one thing, most clients understand
Mic-E data. But more importantly, it turned out to be a big source
of bugs and hence duplicate packets in the network.

I suggest that translating weather data in the same way would
be a similarly bad idea.

I agree, it was a lousy idea. That's why I posted it...to find out what was
wrong with my thinking.

<grin>

Thanks to all for thinking about it. The real problem was the solution was
worse than the problem.
Making it easier to translate/retransmit creates more problems than it
solves!

Rendered body type: text/plain

Greetings all-

myself and another teacher are trying to put together a balloon launch unit for our classes (High School) next year. We would like to transmit gps data, temp, pressure and radiation using APRS. Any suggestions on the interface in the balloon? Can I still get a MIM to feed all of that data in AX.25 to the radio? Any expertise would be appreciated.

I've already lobbied some people for gps and GM tube donations. We'll see how that goes.

Rendered body type: text/plain

I have the following APRS related items for sale. I wanted to offer them here before going to ebay with them.

1. Kenwood THD7A, (does not have the G upgrade) plus the following accesories:
    MAHA MH C888 quick charger and THD7 battery cup
    BT11 AA battery holder for D7A
    PG-3J cigarette lighter charger/ps for D7A
    Kenwood black case for D7A
    GPS and PC cables
    $325.00 plus shipping

2. Kenwood TM D700a plus the following accesories:
    Mic extension cable
    GPS cable
    $475.00 plus shipping

3. Rand McNally GPS receiver. Don't remember the model #.
    This is the one designed for a laptop and mobile operations.
    $40.00 plus shipping

4. Garmin GPS 40
    35.00 plus shipping

5. Kantronics KPC3 plus ver. 8.3
    $125.00 plus shipping

All items are working order and guarenteed to not be DOA.

If interested please email me off sig. ki5df@cox.net

Thanks, Mike

Rendered body type: text/plain

I just returned from a 10 day trip west and was trying to use several of the AHUBS while mobile. Many locations along my route on Interstate 10 from

South Florida to Austin TX did not have any APRS coverage. Armed with a 3G PCMCIA phone I was able to connect to the IS and get my position out while blasting down the interstate but it was very unstable.

I am not able to offer much facts since it was tough playing with the laptop while towing a trailer but I would often connect get a few stations and the stream would go dead, not fail but go dead. I would try another hub and the same would happen or it would connect but no data would pass. This was not a phone issue since I would not drop the call and it happened a few times while I was stopped or in a hotel room.

FYI COVERAGE: Notes taken show that APRS RF coverage in Western LA is zilch till you get to Baton Rouge, AL coverage only in Mobile and FL Panhandle coverage is there but the TX side has some problems. Digi's would hear me but I would decode very few if any packets. Portions of TX that I traveled seemed very well covered except for a short time between Houston on I-10 and where the Austin Region starts on 71.

A digi in the Lake Charles LA area at a high location may very well link up the Baton Rouge and Houston regions. Plenty of population in that area if anyone has contacts there.

Aren't they still on the old APRS frequency down there? I remember
seeing a map somewhere that showed the APRS coverage down in the
southern part of LA being a different frequency. Not that this helps
you with "regular" APRS coverage, but maybe an explanation. Just
FYI.

73s,
Eric KF4OTN

Charlie,

I just tried using my FT-1500M for APRS and Packet last week as I planned on
using it for a local special event. That event was the Miller Lite Ride for
the Arts. This event draws upwards of 10,000 bike riders. Back to the
topic at hand. During testing the FT1500M was not heard very well by the
local APRS digi's. I too use the KPC-3+. The decode of the packets seemed
better then the transmit. Retaining all the same equipment except swapping
the FT1500 for my TM-V7 there was a significant increase in performance. I

tested the FT1500M at all power levels. The performance was so bad I took
it back to the dealer for warranty repair. When using the FT1500M I would
occansionly get poor signal reports. I beleive that there is something
wrong with my FT1500M as well. I also would like to hear from others.

The V means you have a bad fix. You want an A there.
(My memory trick: V=Very Bad A=A-OK, thanks to Mark Winingham)

On TAPRs web site they are selling the TAC (Totally Accurate Clock)
Following links, I find the software page a program that administers this
clock.
There is a 30 day demo of it at this page http://www.cnssys.com/tac32/

I have been able to use this trial version to initialize and set up Oncores
that had ceased to function or needed reinitialization.

I can see Bob hitting his head against the table (Why don't they
understand????)

Yes, it's easy to change it. and no you should not change it. EVERY station
(with few exceptions, and yours does not qualify) should have its ALIAS as
RELAY. When Bob replies he'll explain it (for the, what? .. 42nd time?)
again.

Sorry, I'm trying to joke a bit .... I realize many folks are new (and
haven't read Bob's reasonings on this .. or read the sometimes missing or
sometimes hard to find help files on this) If you really, really want to
you can (in APRSDos type O-C-T and then you are connected to the TNC ..
then use the command MYALIAS) but it's not a good idea. You'll be hurting
the network, and doing a disservice to mobiles traveling near you....again,
Bob wlll explain better than I can.

I can understand the reasoning behind wanting fixed stations to act as
digipeaters but my antenna is only 10' off the roof and has a range of
around 5mi. My Digipeater is located south of town on 100ft tower in open
country and has a better repeating range. There only 4 of us running APRS in
my neck of the woods and the nearest active Digi to mine is 25 to the north
and about 50 mi to the east. There are none in Nebraska west of me to
Colorado. Most of the APRS Traffic is in Omaha and Lincoln. So it is
redundant to have my house transmitting too. Look up my call on findu and
you'll see what I mean. Dave N0XBN

Yes, if there is another full-time station in your neighborhood that
digipeats RELAY and which will definitely hear _everything_ your station
will, then it _is_ a good idea to turn RELAY off in your station to reduce
duplicate packets.
Thanks, Dave!

I have just purchased one and am using a packet cable the I home brewed from the Yaesu packet cable and added my own end. I am using with a Kantronics Tracker, basically a KPC-3+ and it seems to work great.

Do you have the Packet menu set to 1200? Are you sure your cable is wired to spec? Did you trace it and test with a continuity tester? The Pinouts/Color legend supplied by Yaesu are known to be BOGUS so make sure you have it wired up correctly.

I just purchased a Sony (clie) PEG-NR70V/U palm compatible PDA. I installed PalmAPRS which works nicely but have no idea how to interface a GPS. The unit came with a cradle with a USB connector. Sony doesn't offer any solutions on there web page as options.

I'm not using mine as a tracker, but am using it as the main APRS radio at home. I've primarily used it with a KPC9612+ but think I also used it with an old KPC3. I can check a KPC3+ but I'm fairly certain it will work fine since it does with the 9612.

What are you using for the data cable? I went ahead and bought the one that Yaesu sells though I've heard of others making them out of mouse extension cables and the like.

I know of a couple people that bought FT-1500's after I brought mine in for a show and tell at one of our club meetings. I'll ask them but I haven't heard of any of them having problems either.

Bill

Hi Brian,
Your last sentence caught my attention. I was about to go out and purchase an FT-1500M for use with a KPC3+. What are the problems with the pinouts and color legend? I did a quick search on the web for the info and ran across this lone post (just recently placed):

- -

the pin out for the mic jack is as follows ,looking at the side of the radio, with the jack locking tange
pointing down the contacts from right to left are
1.sw2-multi function switching
2.sw1- multi function switching
3. +9v
4.GND.
5. MICROPHONE INPUT
6.PTT [CLONE]

THE DATA JACK
1. DATA IN
2. GROUND
3.PKT PTT
4.DATA OUT 9600BPS
5. DATA OUT 1200 BPS
6.SQL

HOPE THIS HELPS
DALE K8PEO

- -

My assumption that all you need to talk to the TNC is the DATA Jack's pins 1, 2, 3 and 5 is supported by http://www.packetradio.com/!TNCables/060KV.gif. What is pin 6 used for?

```
Did you set the drive level on the KPC 3+?
Can you check the deviation on the 1500?

John Ackerman N8UR did a nice write up on setting deviation levels for
packet radios.
It's worth a read:

        http://www.febo.com/packet/layer-one/transmit.html

> AX.25 to the radio? Any expertise would be appreciated.

The MIM is perfect, and we have given our MIM board design to Stanford
University so thta they will put them into production. I have been doing
a terrible job of maintaining production and filling orders, to once
Stanford has figured out what they are going to charge for them, then you
will be able to get them from them...

P.S. We still sell the MIM chip for $19.90 if you want to incorporate it
into your own board layout. The only other specil chip you need is the
EEPROM and a few transistors and a 5v regulator...

Bob

The YAESU branded cable that I purchased had a supplied
"Legend" that matched the colors of the cable to pin numbers on the molded
connector end.
The problem was that the supplied cable had at least one color (I don't
remember which one(s) that did not match with the colors specified on the
chart, I think that some of the colors also were not to the pins stated.
I wrote Yaesu and complained that the only reason I purchased their cable
was to get something with an accurate legend and I could have just cut up
some old cable and figured it out on my own, which was what I ended up doing
with theirs in any case.

> I don't need it to digipeataas we already have two wtihin 35 mi of each
> other.

Not konwing your particular circumstances, let me elaborate a bit on some
general concepts that might be germane to others...

Wow, the typical digipeater range to a mobile for an east-coast digi at
say 100' HAAT is typicall less than 10 miles or so.  If your digipeaters
are 35 miles apart, then that is a perfect example of why you need to have
all home stations supporting the ALIAS of RELAY..

Most new hams to APRS argue that VHF repeaters work much much further than
that.  But that is TRUE for voice where mobile flutter does not dissrupt a
voice QSO at all...  But in mobile APRS packet, even a single millisecond
flutter anywhere in the entire packet will kill the whole thing.

On our local voice repeater we typically claim 50 mile radius for
usable voice.  But for APRS from a similar location, we are lucky to get
10 miles, usually less...

So be very cautious before you go disabling one of the fundamental
concepts in APRS that any station  will be avaiable for you to use as a
RELAY from your mobile...

To answer your question for APRSdos, open up the CFIGxxx.APR file in yoru
root directory and look for RELAY and change it to NONE...  But again,
only do this if your local circumstances demand it.

It is frustrating to drive near an APRS basestation and for it to not
be serving nearby mobiles...

Another thing to check is to make sure that NO ONE in your area is using
an outgoing path of RELAY,xxxx,xxxxx from another basestation.  If so,
then that is the problem, not the fact that your stations is acting as a
RELAY...

Hope that helps...

Having no trouble here at all with it, tried it in APRS for a while, but I originally bought it for SSTV. It's the same pinout on the data jack as the TM-V7A.

Based on what you describe above, then your station should never be digipeating anyone unless a mobile drives within 5 miles of your home station. And it sounds like there are very few of those in your area..

If your station is digipeating other people becauuse they are putting RELAY in their outgoing path, then THEY are the ones operating incorrectly. The thing ot fix in this case is to educate those other users NOT to be putting RELAY in their paths unless they are a mobile...

Then the nework works as designed. Your RELAY is there for any nearby mobile that cannot hit the digi (or when the digi goes down), but otherwise, your station doesnt add any QRM because noone but mobiels should be using RELAY in the first place...

Turning off RELAY at your home station is like turrnig off the 911 phone service because people are abusing it.   It is better to fix the abuse than to disable the emergency capability...

Just something to consider...

> Yes, if there is another full-time station in your neighborhood that
> digipeats RELAY and which will definitely hear _everything_ your station
> will, then it _is_ a good idea to turn RELAY off in your station to reduce
> duplicate packets.

But, there is a flip side to that also...

1) Both stations will hear it at the same time and will digipeat it at the
same time. Usually only one of these will be heard by the local DIGI, so
this fratracide is part of the concept for reducing clutter.

2) mobile range to a typical home station is usually less than 5 miles.

Even if the homes both hear a mobiel some of the time, then that
probability is still very small. Hardly worth worrying about.

If the houses are 2 miles apart or less, then it probably makes sense to
disable one of them. But disable the on that is NOT on back up power...
Remember, that multiple relays also help to provide black-out redundncy in
time of trouible....

213. [aprssig] First Digi

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 7 Jun 2002 11:23:24 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83783-2002.06.07-10.59.43--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here is an example of why it is important for the APRS system to retain
the FIRST digi heard in any RF path (NOID). We have a station locked up
that is transimtting every few minutes a maximum length 256 byte packet
full of non-printable ASCII characters. Looking him up on FINDU gives
this:

```
 STATION: XXXXXX
 5329.2 miles southwest of BYRD STATION, ANTARCTICA
 Report received 5 days 14 hours 13 minutes 20 seconds ago
 Raw packet: XXXXXX>SXPZLZ,K4EME-3,N4EVA-10*:'j/ol#&K\]"5x}
```

But from this, it was trivial to go to K4EME-3 and see that this station
is somewhere in the mid Virginia region... I konw this is not a WIDEn-N
packet, but it was comforting to see that his entry-digi was easy to
locate...

Rendered body type: text/plain

If you read the web page, there's nothing included except the PIC and what
appears to be a non-silkscreened phenolic PC board. And it looks like it
must ship from Argentina. Gustoavo's ad in this newsgroup was titled Cheap
'TinyTrak' so even if you think he is in the clear because it's called a
Tiny Tracker on the website, it's still a lousy thing to do, particularly
since Byon asked him not to do it.

If you really wanted to build a TinyTrak I from parts, you could just get
the original circuit board from Far Circuits, copy the code from an
existing 16F84 and then gather up all the miscellaneous parts from Digikey
or Mouser. In the end, you'd likely spend more than just buying a TinyTrak
II kit directly from Byonics, and you'd miss out on the nice features that
have been added to the TinyTrak II such as Smart beaconing and switchable
messages.

I wondered why it was necessary to set the protect bit on the code in the
TinyTrak II and after reading this, I can certainly see why.

Isn't what you are suggesting what Byon asked the other fellow not to do?
(copy his firmware)

In any case, if someone wants a cheap TinyTrack, there is always SOTT (Son
of TinyTrack) and that is a opensource project.

>I wondered why it was necessary to set the protect bit on the code in the
>TinyTrak II and after reading this, I can certainly see why.

Before this, I always thought the TinyTrak I was distributing the hex file
so anyone could burn a part. Maybe this was a oversight. Don't know.

As I am fingering my credit card and trying to figure out the closet best
buy ;-)

>Anyone know if the transmission formats will be cross-compatible?

I'd like to hear what you find. I had a long conversation with Garmin and they seemed unwilling to release their protocol, instead suggesting one poll weighpoints in a Rhino to import data into APRS-IS. Of course, this would eliminate external antennas (for recieve only) which would lessen the range of recieved posits. They did indicate to me if someone where to do this, then they might be willing to release some info (I guess kind of a put up or shut up.... fair enough).

MX-COM/CMLMICRO is making chips for this purpose. See:

http://www.cmlmicro.com/products/twoway/CMX882.htm

But when I asked them who had adopted their chip, they would not say. But reading the spec on the chip, it truly sounds like they understand the radio end of UI transmissions (they are using MSK plus FEC).

But I truly hope the industry adopts a standard.

Regards,

Jeff

218. [aprssig] Help with Motorola Oncore GPS unit (PVT6) 6 channel

From: "Robert G. Chimel, WA3LWR" <wa3lwr01@epix.net>
Date: Fri, 7 Jun 2002 22:02:21 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83876-2002.06.07-21.38.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

I bought a used Motorola Oncore unit, which IDs as a Motorola PVT6 it is a six channel unit. It came with an antenna which seems to be working and I have tried simply using my roof mounted Butterfly Vertical.

The problem is that while the system talks to me and response well to self checking and such, it is not picking up ANY satellites and therefore does not have any way to figure out where we are located. I have tried teh Win Oncore 12 program, the Syntac and Tac32 programs. On the Tac32 program the only light up status is position hold.

The raw data is giving the V beofre messages which means it does not have an accurate fix/ It is transmitting every ten seconds and the self check come up with no apparent problems. The Tac 32 program tells me that the UTC time from GPS is Day 159 and the correct time and date the GPS Week = 1169 The system further tells me that there are no satellites tracked and none visable No signal is found for any of the satellites.

THe antenna by the way is presently sitting on the garage roof and has a good view of most of the sky.

ANy suggestions are greatly appreciated.

Bob

Robert-

You say you think the antenna "seems to be working". How do you know?

I hope that butterfly doesn't look like a short, because the Oncore sends
power up the coax to power a proper GPS antenna.
You may have fried something in the Oncore now, which will render your unit
a brick.
Check for at least 5VDC on the antenna jack!

I suggested you try the TAC32 program, which (last time I looked) did a
good job of waking up an Oncore, so now I am worried about your antenna or
the power supply for it. There are a few diagrams around for building a
non-amplified GPS patch antenna.

Also, DOS APRS comes with a program called Motorola.bas that will set up
an Oncore too. It is a little flaky, but sometimes you can make it
work. It requires a DOS environment. It is possible that the FTP
area on http://bsrg.org contains a compiled version of it by KD4Z.

220. [aprssig] 'calibrating' temperature sensor (thermistor)

From: "Bob D." <n2iph@comcast.net>
Date: Sat, 08 Jun 2002 09:24:56 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83914-2002.06.08-09.01.10--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Someone wrote: "You can 'calibrate' it using ice @32 degrees"

You can not truly 'calibrate' the thermistor (in this circuit),
as you have no adjustments for zero, linearity, and span.

You have only one adjustment, which will let you shift the
thermistors response curve up/down to obtain the desired output.
It _will_ be accurate at the one, reference temperature and
acceptable accuracy over its stated usable range (see the data
sheet of the device).

Using an Ice/Water bath (a small container filled with ice
topped off with water, let it stand for a few minutes) you
will have a reference standard at 32F/0C, and you can then
adjust your trimpot so your display/output yields a 32F
reading. Whatever you get at -10F, 70F, 212F, or any other
temperature is dependant on the response curve of the
thermistor and the conditions it operates under (the
temperature effects on the balance of your circuit).
You will need a known good (accurate) thermometer
to 'normalize' your sensor at any other reference temperature.
If you have a darkroom thermometer used for processing color
photos or film, or a good glass tube mercury thermometer
around, they may be your most handy sources of a reasonably
accurate temperature reference. If you have something with
equal or better accuracy, great, use it. Your best overall
accuracy would probably be obtained be 'calibrating' the
thermistor at the annual average temperature for your area.

Ice and water can only exist at one temperature, 32F(0.0C), which
is why it is recognized as a reference standard for 32F/0C.
If you wanted to split hairs, the boiling water reference would
require knowing the atmospheric pressure to determine the true
boiling point at that elevation, so for someone at (or near)
sea level, this is easy, but someone on Pike's Peak, the boiling
point of water is different. I realize that we are not trying to
obtain accuracy to the hundredth of a degree here, just trying to
make everyone aware of the limitations of this particular application.

I notices the Quakes are not showing up on my maps under WinAPRS V2.6.1 and
they were until the upgrade from v2.5.1
Does anyone see them with v2.6.1?

Jim

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83919-2002.06.08-11.07.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have up running a little web server that listens to the APRS/IS data stream, parses "some" of the
data, and then can server out data based on queries. No, this is not a FindU replacement. The program
is running at http://4.63.238.131:8800. You can enter a callsign or part of a callsign, and the latest
data you request will be returned. Note, packets are aged and displayed like this: [D H M S] where D

is Days, H is Hours, M is Minutes and S is seconds. Example: [0 0 8 20] would mean that packet was heard, 8 minutes and 20 seconds ago.

You can also get Street Atlas USA Maps of APRS positions.
Example: http://4.63.238.131:8800/Map.sa9?Range=50:Callsign=KH2Z
The Range figure is in miles, and Callsign is that of an APRS station. Maps can be based on Latitude and Longitude, or Grid Square.
http://4.63.238.131:8800/Map.sa9?Range=50:Latitude=34.04:Longitude=-117.24
http://4.63.238.131:8800/Map.sa9?Range=50:Grid=DM14JA

You can also create SA Maps with drawing objects of your choosing. Click the URL Docs button for some of these options. And example:
SAMap.sa9?*Circle,LINE,FILL,LINE_COLOR,LINE_SIZE,FILL_COLOR,FILL_STYLE,LATITUDE,LONGITUDE,RANGE
http://4.63.238.131:8800/SAMap.sa9?*Circle,1,1,0,1,2,2,34.04,-117.24,15

You can combine multiple drawing objects in one map, just separate each object by a colon. Example:
http://4.63.238.131:8800/SAMap.sa9?*Circle,1,1,0,1,2,2,34.04,-117.24,15:*Circle,1,0,0,1,2,2,35,-118,20

If you have a version of SA other than SA9, substitute that version in place of SA9 in the above examples. SA3-SA9 should work. SA3 does not support Circles, Lines or Polygons.

Rendered body type: text/plain

Robert -

The PVT6 needs an updated almanac. TAC32 will report "bad almanac"

It takes a while (15 - 60 minutes at my location) for the almanac to be picked up, depending upon coverage you are getting from the satellites. I just installed a surplus Oncore GT+ ... and "uploaded the almanac from my Oncore VP (just impatient)

I will send to your e-mail address some programs that may help.

Greg

224. [aprssig] WinOncore12 software

From: "Gregory Beat" <gregory.beat@attbi.com>
Date: Sat, 8 Jun 2002 11:30:05 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83923-2002.06.08-12.06.28--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If you have an earlier Motorola Oncore receiver and are still using the original DOS program supplied by Motorola or the original Basic program developed by Tom Clark, you may wish to look at WinOncore12 that runs under Windows 95/98/2000, and NT. The software is available for download from Synergy's web site OR Motorola's Oncore home page (not yet on the TAPR web site):

http://www.synergy-gps.com/

http://www.motorola.com/ies/GPS/

Although I use TAC32 for almost all of my Oncore functions, WinOncore is very useful in download and upload almanacs (*.alc) from the Oncore GPS receiver. This reduces the time for the receiver's first time fix AND initializing a receiver with a bad almanac.

http://www.motorola.com/ies/GPS/products/winoncore12.html

WinOncore12 is a software package designed for use as an evaluation and testing tool in conjunction with Motorola's Oncore GPS receivers. This utility will aid the user in initializing and operating the Oncore receiver; displaying, plotting and printing data from the receiver; and recording and replaying data files. Using WinOncore12 with your Oncore receiver will help you learn the operation of the receiver as well as enable you to thoroughly test the receiver.

WinOncore12 operates with GT, UT and M12 Oncore GPS receivers. The VP, Basic, and XT Oncore receivers may also be used with WinOncore12. [The PVT6 may also be supported as the "Basic" model, depending upon embedded software version. Flash upgrade information available from Synergy]

WinOncore12 supports both NMEA and Motorola Binary protocol and thus may be used to record live data or playback previously recorded data from a NMEA (*.GPS) file or Motorola Binary (*.bin) file.

WinOncore12 will run under Windows 95/98/2000, and NT.

Subject: [aprssig] Precision Emergency Automated Position Reporting System (PEAPRS) test set

On the ARRL Web site today:

Precision Emergency Automated Position Reporting System (PEAPRS) test set: The Air Force Research Lab, Rome (New York) Research Site, will be conducting an experiment using Amateur Radio operators as an auxiliary line of defense against aircraft disasters in conjunction with the annual Team Patriot exercise. The ARRL is co-sponsoring the test. The test will consist of two aircraft flights some time between June 3 and June 8, 2002. During these flights the aircraft will transmit a distress message, using the call sign WA2ZXS. Amateurs wishing to participate in this exercise should, upon receipt of the distress message, send an email message to peaprs@rl.af.mil detailing the time, characteristics of the message received as well as the method they used for reception (direct, via digipeater, via wide relay, Web, etc). Those who do not have e-mail available to them may participate by calling their observation info into the PEAPRS Command Center at 315-330-7444. The objective of this exercise will be to measure the timeliness and accuracy of the reports received from the amateur community. Amateurs that participate in this program will qualify for a special certificate from ARRL recognizing their participation.

227. [aprssig] What's with EMERGENCY MESSAGES???

From: "Spider" <spider@rivcom.net>
Date: Sat, 8 Jun 2002 10:31:05 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-83936-2002.06.08-13.07.50--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am seeing packets galore going by, such as....

```
WA2ZXS>APRS,TCPIP,W1TYL*:@080907z4401.93N>07545.11W/311/369/Mic-E/M7/EMERGEN
CY!>":w}
```

(note: I am not picking on anyone specific...there are a lot of them...the above packet is just an example)

What is with using the words EMERGENCY or SOS or MAYDAY on a worldwide system???

Have things changed??? 20 years ago this would have caused the sender to receive, at least, a slap up side the head for all sorts of good reasons.

IMHO, it is acceptable to use these words during a test or actual situation AS LONG AS specific information is also INCLUDED. You see any in the packet above?

IMHO, it is unacceptable to use such words WITHOUT specific information included.

As you can see I have a lot of IMHO's, but they come of years of experience in the communications field.

Has the use of the words "BREAK" or "BREAK-BREAK" or "BREAK-BREAK-BREAK" changed too?

Please send your comments to the list...

Jim, WA6OFT

Hi ZZZach!
Again, what "if" you do not have email???

This brings up another question.  Should an emergency message of any kind be
sent encoded???  I think they should be plain text as standard protocol.
A sender "assumes" people can decode an encoded message.  Bad assumption.

Re read my email.  I am not picking on a specific packet.  However, what
good does a bulletin, such as below, do for a person that my not have access
to it or the internet?  It's really pointless and the data collected proves
what?  How many people read the bulletin and responded??  I'd like to see
what statistics are used to prove whatever, no disrespect intended.
I really think some education on sending such messages are in order.  Take,
for just one example, the WX bulletins, warnings,etc.  They send a warning
and it includes specific information on the warning or bulletins,  IN PLAIN
TEXT.

Subject: [aprssig] Little Experimental Program

I have up running a little web server that listens to the APRS/IS data
stream, parses "some" of the data, and then can server out data based on
queries.  No, this is not a FindU replacement.  The program is running at
http://4.63.238.131:8800.  You can enter a callsign or part of a callsign,
and the latest data you request will be returned.  Note, packets are aged
and displayed like this:  [D H M S] where D is Days, H is Hours, M is
Minutes and S is seconds.  Example:  [0 0 8 20] would mean that packet was
heard, 8 minutes and 20 seconds ago.

You can also get Street Atlas USA Maps of APRS positions.
Example:  http://4.63.238.131:8800/Map.sa9?Range=50:Callsign=KH2Z
The Range figure is in miles, and Callsign is that of an APRS station.  Maps
can be based on Latitude and Longitude, or Grid Square.
http://4.63.238.131:8800/Map.sa9?Range=50:Latitude=34.04:Longitude=-117.24
```

http://4.63.238.131:8800/Map.sa9?Range=50:Grid=DM14JA

You can also create SA Maps with drawing objects of your choosing. Click the URL Docs button for some of these options. And example:
SAMap.sa9?*Circle,LINE,FILL,LINE_COLOR,LINE_SIZE,FILL_COLOR,FILL_STYLE,LATITUDE,LONGITUDE,RANGE
http://4.63.238.131:8800/SAMap.sa9?*Circle,1,1,0,1,2,2,34.04,-117.24,15

You can combine multiple drawing objects in one map, just separate each object by a colon. Example:
http://4.63.238.131:8800/SAMap.sa9?*Circle,1,1,0,1,2,2,34.04,-117.24,15:*Circle,1,0,0,1,2,2,35,-118,20

If you have a version of SA other than SA9, substitute that version in place of SA9 in the above examples. SA3-SA9 should work. SA3 does not support Circles, Lines or Polygons.

INcluded in all copies of APRSdos in the PROGRAMS directory is a program called MIC-TEMP.BAS. It is a graphical program that plots the curve of the Digi key thermister and lets you use the arrow keys to manipulate the series and shunt resistance to get the best possible fit of the linear part of the curve to your temperature of interest AND to coincidently get the DECIMAL value (0-255) come out to read directly in degrees over that range!

Subject: [aprssig] What's with EMERGENCY MESSAGES???

I am seeing packets galore going by, such as....

WA2ZXS>APRS,TCPIP,W1TYL*:@080907z4401.93N>07545.11W/311/369/Mic-E/M7/EMERGEN
CY!>":w}

(note: I am not picking on anyone specific...there are a lot of them...the
above packet is just an example)

What is with using the words EMERGENCY or SOS or MAYDAY on a worldwide
system???

Have things changed???  20 years ago this would have caused the sender to
receive, at least,  a slap up side the head for all sorts of good reasons.

IMHO, it is acceptable to use these words during a test or actual situation
AS LONG AS specific information is also INCLUDED.  You see any in the packet
above?

IMHO, it is unacceptable to use such words WITHOUT specific information
included.

As you can see I  have a lot of IMHO's, but they come of years of experience
in the communications field.

Has the use of the words  "BREAK" or "BREAK-BREAK" or "BREAK-BREAK-BREAK"
changed too?

Please send your comments to the list...

Jim, WA6OFT

I know this gets hammered all the time. Every time I think I get the best path figured out something changes my mind.

Here is the trip.

Motorcycle(Honda 750 ACE) ride from Key West, Fl to Homer, Alaska
Departing June 28
KW to Pensacola then shortest path (perSA7) to north end of I15,etc

Radio: GE Phoenix SX
Encoder: Pic-E

I will have a laptop but it will not program the pic-e. I am, therefore, limited to two path configurations
```
I thought   relay, wide2-2
                   wide2-2
```
Beacon every 7 min.

Is my memory correct that in the Keys "relay" does not work?

Would something else have a better chance of getting to igate?

Thanks
Roger

Roger, use relay,wide, wide or relay,wide2-2. That should do the job for you. Anything more is overkill. There is a small portion of the western USA that does not use relay in the alias. You should be just fine and get to an IGATE most of the trip where IGATES are in service.

WinAPRS 2.6.1 testing so I can help a few of the locals setting up the program.

When this starts to show up, does this result in the updating of the station list on a FIFO basis, or is any new informaton being lost. It has been so long since I ran a copy of WinAPRS that I can't recall the particulars.

My guess is that once the station list is full (mine is set to 8192), as a new call comes in, the oldest one in the list drops out (First In/First Out), but not being sure, I don't want to misinform new users of the software.

Some are just clearing their whole station list once this warning comes up, and that strikes me as a strange "requirement", so I'm betting it isn't required, and the warning message can be safely ignored without loss of "recent" data.

Confirm please? 73

It's interesting how many of you responded to my question, when my question
was nothing about a specific excercise other than I used it's packet as an
example to see if anyone could catch was I was getting at...which, so far,
only one person has.
However, I'd truely be interested in seeing the results of this particular
excercise and the conclusions the ARRL comes to and the response the
Navy/Air Force have. Can you honestly say to yourself that you could sit in
front of a terminal (notice I did not say computer) and read the packet I
posted?  From the PACKET I POSTED, without the aid of a computer, can you
tell me exactly what type of emergency, And, keep in mind the vast majority
of amateur radio operators knew nothing of this test.
Even some that "read" the bulletin, did not understand it and attempted to
reply to the beacon.  On both Tests!
Also keep in mind, I knew about it and did participate, when other replies
appeared to assume I did not have a clue about it. And was probably near one
of the first in the first wave of responses with full data on the
transmission, with a complete record as to what their transmission appeared
like, the relays, etc., off the IS as it appeared here, the first go around.

WA2ZXS>APRS,TCPIP,W1TYL*:@080907z4401.93N>07545.11W/311/369/Mic-E/M7/EMERGEN
CY!>":w}

So, in 3 seconds or less, read (with your eyes wide open) and tell me what
kind of emergency this is?
Who:  WA2ZXS sent it.
Time:  080907Z
Location: 4401.93N by 07545.11W
Type:  Emergency

Well, it is kinda hard to do what you want at
the end of your post.

The callsign WA2ZXS is the one that is known to
be used testin' the system. So my first thought when I see
the callsign is, "oh, this is the PEAPRS test station".

What was lookin' at it for 3 seconds supposed to do?

Rendered body type: text/plain

Hi Jim,

Yes, otherwise how could the station list be 8192 instead of the default?
<vbg>

Now...how about an answer to the question I asked. Is the station list a
FIFO or not?
Once the "out of station memory" warning comes up, are new stations still
accumulating, with the oldest station being deleted?

(Not addressed to you, Jim, as I'm sure you would have told me the answer
the first time if you knew.

hasan schiers, N0AN

I just picked up an FT-1500M at Dayton because the price is excellent. I originally used the 1500 with the KPC3+ but wired it to the mic and external speaker connection. That way, I don't have to listen to the audio since it is a dedicated APRS radio and is in the rear "cargo" area of the Ford Escape. It worked perfect from the moment I hooked it up. I just replaced the KPC3+ with a TinyTrakII that I just finished building since I like the intelligent tracking feature of the TTII. Ended building the TTII in an A/B switch box that had three DB9 cutouts on ther rear panel. Wired up on DB9 for the computer input (programming the TTII), one for connection to the GPS unit, and one that is wired up exactly like the KPC3+ allowing me to switch the TTII with the KPC3+ without any changes! Works great with either unit! BTW, pictures of my TTII in the A/B box are posted in the photos section of the TinyTrak group on yahoo groups.

Rendered body type: text/plain

I wish to thank all for replies to my recent post concerning transmit problems from the Data port of my FT-1500M. I am not a rookie cable builder so pinouts, etc, is not the problem and I will not dig into perfectly working good modems to try and correct a radio problem. It works fine from the Mike port but this does not meet my needs.
One fourth of the respondents have exactly the same problem I do, one had been sent back under warranty for the same thing and the rest work fine. A real mystery. (All respondents did not own this rig)
I purchased this unit from a legitimate dealer at a hamfest for less than 100 bucks, it having been used as a demo, and not worth the hassle of sending across the U.S.for warranty repair.

Again thanks to all and we will put this one to rest!

While knowing the type of emergency would be important information for responders, the fact that we know an emergency exists and it's location is far more important.

Without knowing an emergency exists there is no reason to respond. (Kinda like bears pooping or trees falling in the woods. If no one know's there to see it...)

If we know an emergency is occuring, but don't know where it is, there is no where to respond.

When I was dispatching Fire/EMS, we would get 911 calls from cell phone callers reporting a traffic crash and send help. They would hang up before telling us where the crash was. Knowing there was a crash, but not knowing where it was, caused us to do nothing except wait for another caller to tell us where the crash was.

```
I'm not a cell phone user, but I do know that the FCC required
at a date that has past that cell phones give their location to
911 centers similar to land line phones.

I also know that we're not supposed to be seein'
analog TV and TV stations aren't supposed to have two
channels any longer.

The general masses (ie the ignorant) believe these things
are so, because the government has told them.

So all y'all will have to excuse them.  We hams keep up with
stuff like this and realize when the FCC says that somethin's
gonna happen it is more likely that it won't happen
than will.

Subject: [aprssig] Re: What's with EMERGENCY MESSAGES???

While knowing the type of emergency would be important information for
responders, the fact that we know an emergency exists and it's location is
far
more important.

Without knowing an emergency exists there is no reason to respond. (Kinda
like
bears pooping or trees falling in the woods. If no one know's there to see
it...)

If we know an emergency is occuring, but don't know where it is, there is no
where to respond.

When I was dispatching Fire/EMS, we would get 911 calls from cell phone
callers
reporting a traffic crash and send help. They would hang up before telling
us
where the crash was. Knowing there was a crash, but not knowing where it
was,
caused us to do nothing except wait for another caller to tell us where the
crash was.

Pretty good story. However, you mentioned emergency and not knowing and
then you mentioned it as a crash, so you knew.
Would you send a team out, unprepard in regards to walking up to a bear
pooping in the woods? <G> Or walk into a forrest with trees falling in the

woods. What would you send? Swat team, fire, medical, police, Poo-Bear? <G>
I see what you mentioned all the time....it's hard to be a 911 dispatcher!

Interesting. I've done the same thing with mine, and an Alinco DR-1200 .
That puts APRS and SSTV back in the cargo area, along with a large gell
cell, and their antennas, and really de-clutters the cabin.

I'm using USB serial to talk to everything, one USB cable to the back, from
the laptop.

> tell me exactly what type of emergency, And, keep in mind the vast
majority
> of amateur radio operators knew nothing of this test.

Well, not to pick nits, but without a COMPUTER running APRS you would not
have seen the packet you posted. This test came from a D7, which sends
compressed packets. The packet stream I received from the test (on UI-View
and a D700) clearly indicated it was a test.....

On the other hand, I really do not understand the point of this test.
Setting the Position Comment to "EMERGENCY!" does not test anything. We all
know that if you set that Postion Comment on a D7/D700 the alarms will go
off in every Kenwood in "earshot". But so what?

A few months ago, when it was reported that a dumb-tracker sending the
"EMERGENCY!" Position Comment was sending corrupt packets, there was a
discussion about what this Position Comment means and what one is supposed
to do with it. The philosophical question was this: Does "EMERGENCY!" =
MAYDAY. IMHO, it does not. Only MAYDAY (an internationally recognized
distress call) = "MAYDAY". Anything else is just (very ambiguous)
information. I don't think that philosophical debate has ever been resolved.

Bottom Line: it is not clear what one is supposed to do if the "EMERGENCY!"
alarm goes off........

Let me butt in here on this one. Having been the first person, read person, not even carrier to have enabled Enhanced 911 in Florida. I work for a Cellular carrier and due to my coverage area of somewhat low population but yet large enough to have E911 (Enhanced 911) I got picked to do the first tests and go live.

Cell phones, PCS phones, any wireless phone does NOT give a users exact location, maybe in the future but that is still in the planning phase. Also you may have seen claims that some phones can do this and it is true, there have been designs but I do not believe any are on the market since the infrastructure does not exist.

There is 911 (just routes you to a PSAP in the area)
911 with a form of ID (tells them what cell site you are off and what antenna sector)
Enhanced 911 which gives you the call back number (caller ID, number no name and SOMETIMES what sector)

Future... Caller ID and Location.

Also your milage may vary depending on the PSAP, sometimes the coordinator does not even care what sector you are on so
that will not be included the display. Since we are working on radio here the routing may or may not be correct, that is based on the county 911 coordinator and where the cell site is. The antenna direction may aim towards a town or unincorporated zone but you may be in another so it is important to give your EXACT location since you may have gone to another agency that does not serve the area. I do about 1K miles a week working so I use 911 all the time, this is important and it is important to stay on the line. I have had cases where the answering party has asked me to call another number, has not been able to forward my call to another agency, or has forwarded me to the wrong number, they stay on the line but you got to stay on there with them!

Under extreme circumstances there can be a trace put on the phone where we can monitor the system and see what cell sites the call is handing off from and from which antenna face. But so much is needed that it is rare, 1st they need to know what carrier to call, 2nd we need to know the phone number of the customer, 3rd we need to get someone in the Engineering Dept to run the unix script, 4th the caller must stay on the line and be moving so we can monitor the handoff's, 5th it would need to be done during the day when someone is in that department or call someone in which takes time. This just gives us direction of travel and general area.

Future plans are for triangulation based on the cell sites (DF'ing)that are hearing your call for your location and also phones with built in GPS receivers for a "aprs" type of positioning but who knows when. And remember, there are still many places which do not have any information whatsoever on your call, all they have is a phone no display, one nearby county is still in the stone age.

So please don't have a false sense of security, this is the inside scoop, no one uses any "presudo APRS" features for wireless phones at this time.

Well, I think you said that the cellphone users thought
you were gettin' there location on your 'puter when they
called 911.

They are told this and believe, even thought
we know that not a lotta 911 centers are equiped for this.

They believe this because the FCC told 'um so.

> Now...how about an answer to the question I asked. Is the station list a
> FIFO or not?
> Once the "out of station memory" warning comes up, are new stations still

> accumulating, with the oldest station being deleted?

> hasan schiers, N0AN

When it states 'out of memory', no new stations appear anywhere. It is NOT FIFO, removing the oldest station. All old stations are retained, nothing new appears. The buffer is ka-put. <g>

memory.txt will control buffer sizes:

```
STATIONS<tab>8192
MESSAGES<tab>8192
```

Winaprs can't rewrite buffers once they are established at program startup. However, you can clear stations manually, using the EDIT tab. Messages are handled differently.

I have not played with larger buffer sizes, but they should work if you have enough available computer memory. You can also use the station time out feature in settings. If you set it for 2 hours... stations not heard during that time period are removed from your lists.

Hope that helps.

As I recall, the cellphone sustem has nothin' to with APRS.

It would transmit the coordiantes of the cell phone to the 911 center.

As I said earlier, I'm not a cell phone user. However, readin' about it, I think the FCC was thinkin' about a a kinda phone with built in GPS that would give the 911 center the location of the caller.

Well, I think you said that the cellphone users thought
you were gettin' their location on your 'puter when they
called 911.

They are told this and believe, even though
we know that not a lotta 911 centers are equiped for this.

They believe this because the FCC told 'um so.

The question that no one has asked:

Why was the callsign WA2ZXS?

For many moons (as the injuns would say),
experimental station were suffixed with
a leadin' X.

So should the call have been WA2XZS?

Any thoughts or knowledge on this?

Callsign: WA2ZXS
Name: 416 COMBAT SUPPORT GROUP
Addr1: 5153 BEACON LIGHT RD
Addr2: VERONA, NY 13478
Country: USA
Effective: 05 Jun 2001   Expires: 07 May 2011
Trustee: KA2NIL

Good question! Maybe KA2NIL could enlighten us. I'm sure there is an answer
out there somewhere :)

Callsign look up sez:

Call: WA2ZXS

416 COMBAT SUPPORT GROUP
5153 BEACON LIGHT RD
VERONA, NY 13478

Sounds like a Military Recreation Station License to me since the 416 CSG is an AF
Unit.

> Motorcycle ride from Key West, Fl to Homer, Alaska:
> I thought   relay, wide2-2  or   wide2-2
> Beacon every 7 min.

I would set to once a minute while moving.  You will be out of range of
all digipeaters most of the time.   At 60 MPh, and 1 packet every 7
minutes, you will beacon only once every 7 miles and since mobile to
mobile range is typically 3 miles or so, you could pass right by someone
and never see each  other...  Always set to one per
minute when out of range of digis.  EVEN while stopped so that someone
driving by at 60MPH will see you at the picnic area in time to slow down
for an eyeball...

Now many people will complain about once a minute beacons through their
area.  They dont like to see their maps cluttered by visiting
mobiles actually using APRS...  But since you are on an important long
distance trip, and at  60 MPH you will never be in range of one digi for
more than say 15 to 20 minutes or so in the East..  so  it is truley
doubtful that your position  reports will be that much of a nuisance.  If
they are, turn it off a few minutes every few minutes...

If you cannot easiliy reprogram throughout the trip at all, set
RELAY,WIDE2-2 or WIDE,WIDE2-2.  and just use the ON/OFF switch to keep
your rate down in busy areas... and certainly after you stop even
briefly...  The leading RELAY or WIDE is so that if your GPS fails, then
at least your packets will all arrive at FINDU.COM with the callsign of
your closest digi in the path (callsign substitution).  But again, this
only works in those areas that support NOID on the digipeaters.  Some
areas have ID set and so this ability to track (by frist digi) without a
GPS is lost..

This is why we really need to know where all the areas are that do not
support RELAY other than Southern Calif and I think New Mexico... and
where are all of those digis that have ID set.  I have asked that those
digis be marked with n "I" overlay so that users can tell what areas
support what...

It sounds like 95% of your trip will be completely out of range of
any digis so set up for that mode and then use the ON/OFF switch to
control it in the other 5% if you have a problem...

         I'm using mine as an APRS radio, but I have it mounted up front,
and I'm using the data port on the back of the rig.  Sometimes, I want to
listen to the audio, and sometimes I don't.  When I don't, I just turn the
volume down, and the KPC-3 keeps getting the same audio.  In other words,
the volume control gives me audio, or not, but doesn't affect the audio
from the data port.

>   It worked perfect from the moment I hooked it up.

         Mine did, too, and it's a GREAT setup.  Of course, I bought a PS/2
extension cable and cut one end off to get the cable I'm now using.

>   I just replaced the KPC3+ with a TinyTrakII that I just finished
> building since I
>like the intelligent tracking feature of the TTII.

         I'm using mine with a HamHUD, but it would be pretty simple to
take the 'HUD out of the line and run the GPS directly to the KPC-3.  Not
that I'd want to, as I REALLY like the limited display the 'HUD gives me.

> CY!>":w}
>
> in 3 seconds or less, read and tell me what kind of emergency this is?

There are many erroneous assumptinos that are being made here.  Lets
address them before anyone starts casting stones:

1) The Sender announced on all reasonable channels the presence of a test.
2) The Sender included the words TEST-test in EVERY packet
3) The Sender has taken reasonable measures to alert everyone and to
insure that his message is not missinterpreted.
4) What we DID learn from this test, is that there are lots of poor APRS
implementaions, decoding, and display issues in user software.  Here is
what is wrong, and it is NOT THE FAULT OF THE SENDER:
```

1) The above packet is NOT the original packet. It is a REFORMATTED decoding of the packet. Whatever software did it, did NOT do it properly since it dropped off the "TEST-text" STATUS text what was included in the original packet.

2) OR, maybe the software that did the REFORMATTING puts the STATUS in a separate STATUS location. Such software then should always display both STATUS and POSITION data at the same time...

3) OR, maybe the software that did do the REFORMATTTING did properly put the "TEST-test" text in the right place, but the receiving operator did not properly access both pieces of data before drawing his erroneous conclusions..

This test shows what I have been fighting from the beginnning, that we must have consistent APRS ways of doing things in all users programs so that every user SEES THE SAME THING as the sender intended. As more and more people write APRS type programs, we are seeing less and less commonality...

Here is the guiding principles in this case:

1) ALL stations on APRS have two fundamental items of information, a POSITION and a STATUS. Users, and user software must make users be aware of this.

2) Mic-E packets combine both the POSITON and STATUS informatino into the same single packet for brevity...

3) We have had a terrible time for the last few years with most authors handling the conversion of Mic-E packets differently. The result is a mess. It was initially required beacuse some software would not pass the Mic-E format through the Internet properly. Be assured that everyone involved is working hard at CHANGING the APRS-Intenret system so that it passes through all MIC-E packets unmodified from their original format so that this problem of incompatible mic-E conversions will go away.

But still it is incumbent on every author to properly pull out BOTH the position AND the STATUS from a Mic-E packet and present it unambigously to the user...

That is the problem that this test brought to light.
Thank goodness for the test!

Most of the digis in New Mexico respond to RELAY, there were a couple over around Lubbock that didn't, but I believe that has changed and they now respond to RELAY. (As all APRS stations should).

Thanks! This is good news..
We need EVERYONE's participation in helping us identify non-standard areas. This is NOT an issue of trying to get them to change, this is ONLY an issue of getting everything properly identified so that the users can see what they have to do in any area to have a working tracker. Here are the things we need to do to help APRS travelers:

1) Digis that do not support RELAY, or WIDE to indicate it in their BTexts
2) All digis that operate with "UIDIGI ID ON" should have an overlay "I"

If these two are done, then it will be trivial for an automated system to draw a National map of different colors for the different settings.

But the only way we can assure this is for each and everyone of us to test our own local digi and make sure that it is set properly to indicate its features to users. If they are not, then we each LOCALLY need to get that fixed. Then the national map will properly show what areas support what and any user driving thorugh will be aware at a glance...

Just last week for the first time in a long while I displayed just local digis and was pleased to see that now we have very few non widen-N digis even in our old area... so things do change slowly. Now I need to test them to see if the are doing ID or NOID...

Dick (et al)

Thanks so much for the reply. The key issue was FIFO. Since it isn't, I increased my station size to 16384 and I'll watch it. That is the only variable in my config file. The default packet buffer is 1000K, so I'm just going to watch it. It was obvious that 8192 was not big enough for the station count, but 16384 might be.

I must say that I'm impressed with the improved stability of this version (2.6.1). I ran it 3 days without crashing until I just unloaded it to change config file. That is an all time record for any recent version for me. For me, every version subsequent to 2.4.7 failed within a few mins or hours when connected to the Internet. This is the first WinAPRS version I have ever gotten to run for more than a few mins/hrs while connected to the Internet. It is very nice to see this kind of progress.

As I'm trying to help a few locals out, I'll continue to let it run and see what it can do long term. For my "serious" aprs work, I use APRS+SA. It runs MONTHS needing no attention and is a flawless Igate. Anyone who sees N0AN-6

...that is the WinAPRS long term reliability testing and is connected to the
internet ONLY. Plain N0AN is "old reliable" aprs+sa, current version 2.12.
The only thing that has taken APRS+SA off the air in MONTHS is a cat who has
found the master on/off button on the UPS connected to that computer. Of all
places to step, she likes that one.

> Bill, KC4OUA

If a station isn't heard during the 'time-out' period, it does remove that
station from your lists. Yes, clearing stations seems to reset the buffer,
wiping everything out. A large enough buffer at startup might be the best
way the fly, if you want to see every station on the feed.

Notice the 'Dim out' feature? It doesn't work. Not sure if it ever
worked... the docs don't even explain this feature. Maybe the Sprouls' will
help us with that.

Comment....(my 2 cents)

Depending on where you connect for data (the core), stations could exceed
10,000+ in WinAPRS without some regional filtering going on. AFilter does a
fantastic job by preventing your station from being over-run.
Distance/range filtering is very common for IGate setups. Regional servers
are becoming more popular as the APRS IS grows. Think regional, you can
still 'talk' anywhere :)

How popular are regional servers? Look at the list:

http://www.ahubswe.net/aprs_stat.asp

I think findu and other sources gives us a much better picture as to who is
out there, than waiting for WinAPRS to load up with less informative data.

Thanks for the aprs lesson. I will use relay, wide2-2 every 60 sec. I
will be a "dumb" tracker and if I hear a lot of traffic on the spk I'll
just shut down for a few miles.

I did my 49cc motor scooter trip in 2000 from Jacksonville to Los Angeles
and had great coverage in New Mexico with relay,wide3-3.

I've been logged on the Internet of and on for a few days and it looks as
though I'm going to have a lot of "dead areas" on this trip.

Thanks again
Roger

is it possible to make my digi respond to RELAY OR WIDE? if so, how? I
used to have my tracker set for wide3-3, and it worked fine through IL and
MO....now that i changed it (to relay, wide, i think, dont recall)... I
get lost south of St. Louis.

thanks
Ken

Excellent post, Bob. APRS is well served by assuring its mission isn't lost during coding. It is an "emergency and tactical communication system".

In the absence of a formal document that spells out exactly how each protocol item should be presented to the user (some call it "feature personality"), it is imcumbent on each author to test their coding decisions against the APRS services' mission to assure they aren't compromizing it in some way.

We are dealing with exactly the same issues in the BEACONet community right now (even though most users don't know it yet). I'm working on a "Compatibility Index" against which developers will compare their product to know just how close their product comes to meeting the stated needs of the BEACONet service. I can envision a day when a product can boast a label of 2002/A+, meaning it fully supports every feature that was identified as necessary in 2002. Of course, there may be additions in 2003...whereby their label may drop to 2003/A or 2003/A- or 2003/B+.

Actually, the above oversimplifies the model that I'm working on, but you can catch the drift...and the power of such a system: users can make informed decisions as to what they're going to use, as a prelude to using it. Authors will be encouraged to 'stay current', too. I'd be real wary of subscribing to a product that shows a label of 1999/B+, when I know that there are others with 2002/A+. :o)

Of course, the BEACONet service requires only a small sliver of features of what the APRS service requires, so the implementation of such a system is orders of magnitude easier. This was intended simply to support Bob's statement and to offer some insights into another system that is under consideration right now.

Regards,
Ev, W2EV

Rendered body type: text/plain

No it does not have anything to do with APRS but since you brought it up I thought I would explain some common misconceptions on the way it works.

The FCC has requested a progressive expansion of the 911 system and GPS was one of the options, IF that were to be used a mapping system ploting the coordinates would be the only viable solution since raw coordinates does not help a dispatcher very much that must contact a emergency unit, a actual address does.

There are several options and the FCC is not telling anyone that they must use one, the bottom line is they want an address to a unknown degree in the future when it becomes viable. I believe a date was set long ago but that was not to be, it was way too optimistic of a deadline and they know that.

Subject: Re: [aprssig] Re: What's with EMERGENCY MESSAGES???

As I recall, the cellphone sustem has nothin' to with APRS.

It would transmit the coordiantes of the cell phone to the 911 center.

As I said earlier, I'm not a cell phone user. However, readin' about it, I think the FCC was thinkin' about a a kinda phone with built in GPS that would give the 911 center the location of the caller.

Subject: [aprssig] Re: What's with EMERGENCY MESSAGES???

Let me butt in here on this one. Having been the first person, read person, not even carrier to have enabled Enhanced 911 in Florida. I work for a Cellular carrier and due to my coverage area of somewhat low population but yet large enough to have E911 (Enhanced 911) I got picked to do the first tests and go live.

Cell phones, PCS phones, any wireless phone does NOT give a users exact location, maybe in the future but that is still in the planning phase. Also you may have seen claims that some phones can do this and it is true, there have been designs but I do not believe any are on the market since the infrastructure does not exist.

There is 911 (just routes you to a PSAP in the area)
911 with a form of ID (tells them what cell site you are off and what antenna sector)
Enhanced 911 which gives you the call back number (caller ID, number no name and SOMETIMES what sector)

Future... Caller ID and Location.

Also your milage may vary depending on the PSAP, sometimes the coordinator does not even care what sector you are on so
that will not be included the display. Since we are working on radio here the routing may or may not be correct, that is based on the county 911 coordinator and where the cell site is. The antenna direction may aim towards a town or unincorporated zone but you may be in another so it is important to give your EXACT location since you may have gone to another agency that does not serve the area. I do about 1K miles a week working so I use 911 all the time, this is important and it is important to stay on the line. I have had cases where the answering party has asked me to call another number, has not been able to forward my call to another agency, or has forwarded me to the wrong number, they stay on the line but you got to stay on there with them!

Under extreme circumstances there can be a trace put on the phone where we can monitor the system and see what cell sites the call is handing off from and from which antenna face. But so much is needed that it is rare, 1st they need to know what carrier to call, 2nd we need to know the phone number of the customer, 3rd we need to get someone in the Engineering Dept to run the unix script, 4th the caller must stay on the line and be moving so we can monitor the handoff's, 5th it would need to be done during the day when someone is in that department or call someone in which takes time. This just gives us direction of travel and general area.

Future plans are for triangulation based on the cell sites (DF'ing)that are hearing your call for your location and also phones with built in GPS receivers for a "aprs" type of positioning but who knows when. And remember, there are still many places which do not have any information whatsoever on your call, all they have is a phone no display, one nearby county is still in the stone age.

So please don't have a false sense of security, this is the inside scoop, no one uses any "presudo APRS" features for wireless phones at this time.

Rich K4GPS

Depends on what TNC you are using Ken.. Also, as stated, WIDE3-3 is 3
hops against relay, wide, which is two hops. That could possibly hender
your getting onto the APRS IS if that was your main goal. IMHO, RELAY
should be the first station in the mobile's UNPROTO path and depending
on the locale, all stations/digipeaters should honor RELAY.

I'm running IGate AA9MM, located in Southwest Indiana. I use AFilter
2.69 and WinAprs 2.6.1, which was released after this years Dayton
HamVention.

I'm having a problem with AFilter, and wanted to see if you have any
suggestions. This software is on a dedicated AMD 1.3 Gig Processor,
using an ABit RAID Motherboard. The operating system is Win 98 SE, with
all the latest service packs from Microsoft. There is 512 meg. of
PC-2100 RAM running on this machine. The IGate is running on a cable
modem, with a Linksys 4 port router.

Other than the operating system, AFilter and WinAprs are the only
applications running on this machine. In the past four days I've been
having a problem keeping AFilter connected and running. Below is the
error message I get when this problem takes place. This can be anywhere
from 6 times a day to many dozen.

```
AFILTER caused an invalid page fault in
module AFILTER.EXE at 0177:004060c5.

If its a KPC-3, make the UIDIGI list contain RELAY, WIDE, TRACE and your
states two letter abbreviation..

```
Saturday, while driving around in K9SI-14, I noticed an emergency alert on
the PC in the truck. Then I saw a local station turn red and he had an "A"
in the front of his call in the "P" list. Didn't think much about it and
figured he was just playing with something and was sending out an alert by
mistake. Then when I got home I checked the home computer and saw the same
thing except now K9SI-14 was also red on the screen and the computer was
beeping away. There was also the "A" in front of K9SI-14 in the "P" list.
(All the stations involved here are using DOS APRSMAX.)
        Why was my mobile sending out this emergency message? I didn't do anything
to it that I know of to instigate it. Is the PEAPRS test infectious? Other
than turn off the transmitter, how can I make it go away? When I restarted
the mobile computer it sent out another emergency message that showed up
again on the base station computer. Is there something in the TNC that
needs to be changed? Everything does seem to be behaving normally today,
however.

73,
Al K9SI

Hello all-

I will be visiting the UK next month and would love to take my D7 and gps
along. Since this is new to me, I have a couple of questions:
1.) What is the UK APRS freq?
2.) How exactly do I enter mycall? (M/KB9WVG-7?)
3.) What about paths? Relay, wide n-n?
4.) Can I find digi locations? I will be traveling in London, Oxford,
Portsmouth areas.

Thanks in advance.

Rich, and other thanks for the additional info.

I put a picture of my route at http://www.pbase.com/rockytop then click thumbnail to enlarge.

Most of the route is non Interstate.

I sized it down quite a bit. I have cable and it loads very fast.
Someone give me a report if its still to slow to load.

Thanks
Roger

293. [aprssig] Re: What's with EMERGENCY MESSAGES???

From: "Doug Younker" <dougy@ruraltel.net>
Date: Sun, 9 Jun 2002 15:26:17 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-84145-2002.06.09-23.13.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In my first post, I was commenting in general terms on the topic and apparently my poor composition skills, left an accusatory tone towards the sender of the test packet and that wasn't my intent, sorry. Bob, Wb4APR stated in part;

:
: 1) The above packet is NOT the original packet. It is a REFORMATTED
: decoding of the packet. Whatever software did it, did NOT do it properly
: since it dropped off the "TEST-text" STATUS text what was included in the
: original packet.
:
: 2) OR, maybe the software that did the REFORMATTING puts the STATUS in a
: separate STATUS location. Such software then should always display both
: STATUS and POSITION data at the same time...
:
: 3) OR, maybe the software that did do the REFORMATTTING did properly put
: the "TEST-test" text in the right place, but the receiving operator did
: not properly access both pieces of data before drawing his erroneous
: conclusions..
:
: This test shows what I have been fighting from the beginnning, that we
: must have consistent APRS ways of doing things in all users programs so
: that every user SEES THE SAME THING as the sender intended. As more and
: more people write APRS type programs, we are seeing less and less
: commonality...
:
: Here is the guiding principles in this case:
:
: 1) ALL stations on APRS have two fundamental items of information, a
: POSITION and a STATUS. Users, and user software must make users be aware
: of this.
:
: 2) Mic-E packets combine both the POSITON and STATUS informatino into the
: same single packet for brevity...
:
: 3) We have had a terrible time for the last few years with most authors
: handling the conversion of Mic-E packets differently. The result is a
: mess. It was initially required beacuse some software would not pass the
: Mic-E format through the Internet properly. Be assured that everyone
: involved is working hard at CHANGING the APRS-Intenret system so that it
: passes through all MIC-E packets unmodified from their original format so
: that this problem of incompatible mic-E conversions will go away.
:
: But still it is incumbent on every author to properly pull out BOTH the
: position AND the STATUS from a Mic-E packet and present it unambigously to

: the user...
:
: That is the problem that this test brought to light.
: Thank goodness for the test!
:
: de Wb4APR, Bob

This begs the question, what APRS applications correctly decode the test message? I'm unaware if the test was seen is Western Kansas and if it was the fact, I don't run my station 24/7, means my installation of uiview32 remains untested.

I believe the point Jim was making in his original post is that, the word *emergency* can be read by anyone monitoring the frequency and with out the word test, the monitor wouldn't know how to respond OR even if response is neccessary. It was mention that the word emergency isn't a internationally recognized distress, so what? I really doubt an English speaking person would ignore the word emergency it where heard via telephony or received CW or any other means. While it may be true there may be flaws in how some applications decode packets however, IMO this doesn't absolve any sender of any packet text from putting some fore-thought into a message that can be read persons monitoring with something other than a correctly working APRS application--73

294. [aprssig] Survey Time (kenwood owners)

From: "Wes Johnston" <wes@johnston.net>
Date: Mon, 10 Jun 2002 00:21:19 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-84153-2002.06.09-23.57.53--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just got in from a three day weekend in Myrtle Beach and have been wanting to ask the SIG this question. In case you wonder, no I am not related to Rube Goldberg.

Who would like to add Smart Beaconing to their kenwood radios for $40 ? how about $30 and some junque box parts?

Those of you who don't know what Smart Beaconing is....
http://hh2.hamhud.net/smartbeacon.html

Those of you who do.... here's how you do it.....

1. Build a tiny track 2.
2. Hook the Tiny Track 2 to your kenwood's GPS receiver via a Y cable
3. Set your kenwood beacon rate to 30minutes.
4. Get a basic stamp or 16f84.
5. Program the 16f84 or stamp to watch the tiny trak 2's PTT line. When it goes low, send BE 0<cr> pause for 500ms, send BE 1<cr> to your kenwood's serial port at 9600 baud.

Basically, the tiny track 2 listens passively to GPS data. When you turn a corner it may or may not decide it's time to beacon. When it does, it will pull it's PTT pin low. Mind you, the TT2 is not connected to a radio at all. It is simply there as a supervisory controller. When it pulls it's PTT pin low, another stamp or PIC processor must then command the Kenwood to TX. since kenwoods are always listening for mode commands on thier serial ports, you can toggle beacon mode off and back on and the kenwood will TX right away.

Wes

*No I have not written the code for a PIC yet.... haven't had the time yet.

Rendered body type: text/plain

Tweak update: You can now enter multiple callsigns in the callsign slot, and Map URLs will accept multiple callsigns. Also, Range Rings can be turned on, they are now off by default. Examples of APRS type map requests:
http://4.63.238.131:8800/Map.sa9?Range=50:Callsign=KH2Z
http://4.63.238.131:8800/Map.sa9?Range=50:Callsign=KH2Z:Rings=1
http://4.63.238.131:8800/Map.sa9?Range=50:Callsign=KH2Z,WB6ZSU,N6EX
http://4.63.238.131:8800/Map.sa9?Range=50:Callsign=KH2Z,WB6ZSU,N6EX:Rings=1

Subject: [aprssig] Little Experimental Program

I have up running a little web server that listens to the APRS/IS data stream, parses "some" of the data, and then can server out data based on queries. No, this is not a FindU replacement. The program is running at http://4.63.238.131:8800. You can enter a callsign or part of a callsign, and the latest data you request will be returned. Note, packets are aged and displayed like this: [D H M S] where D is Days, H is Hours, M is Minutes and S is seconds. Example: [0 0 8 20] would mean that packet was heard, 8 minutes and 20 seconds ago.

You can also get Street Atlas USA Maps of APRS positions.
Example: http://4.63.238.131:8800/Map.sa9?Range=50:Callsign=KH2Z
The Range figure is in miles, and Callsign is that of an APRS station. Maps can be based on Latitude and Longitude, or Grid Square.
http://4.63.238.131:8800/Map.sa9?Range=50:Latitude=34.04:Longitude=-117.24
http://4.63.238.131:8800/Map.sa9?Range=50:Grid=DM14JA

You can also create SA Maps with drawing objects of your choosing. Click the URL Docs button for some of these options. And example:
SAMap.sa9?*Circle,LINE,FILL,LINE_COLOR,LINE_SIZE,FILL_COLOR,FILL_STYLE,LATITUDE,LONGITUDE,RANGE
http://4.63.238.131:8800/SAMap.sa9?*Circle,1,1,0,1,2,2,34.04,-117.24,15

You can combine multiple drawing objects in one map, just separate each object by a colon. Example:
http://4.63.238.131:8800/SAMap.sa9?*Circle,1,1,0,1,2,2,34.04,-117.24,15:*Circle,1,0,0,1,2,2,35,-118,20

If you have a version of SA other than SA9, substitute that version in place of SA9 in the above examples. SA3-SA9 should work. SA3 does not support Circles, Lines or Polygons.

Rendered body type: text/plain

One thing I have noticed, with keps up to date, and time synced to 1 second of an atomic, Satellite pass peaks are always a few minutes behind.

Are keps just a well calculated guess at sat position ?

Curious

> accept my ARISS beacon.

Yes, if you have checked the PCsat web page you would have noticed that PCsat has been in power crisis mode from May 10 to June 8. Inorder for the ARISS alias to work, PCsat must be full loaded with all parametters. This is imporssible during low power ops as all digiepating is turned off then as well to save power... And each reset causes a loss of all parameters.

> No criticism intended...

No problem. But its always a good idea to check on the status of PCsat on its WEB page before headed off on a trip to aquaint yourself with the current operational situatino. PCsat will be in full sun through Field Day (23 June) so enjoy. We will try to keep it always loaded...

Also, only use ARISS if you want to switch back and forth easily between ISS and PCsat. If on the other hand, you want somehting that does NOT depend on us keeping ARISS loaded as a callsign, then use W3ADO-1 which will ALWAYS work with PCsat after a reset...

PCsat should work with W3ADO-1 all the time in the sun... Unless we have actively commanded the digipeater off...

As others have responded, you can see the mods.

However, be aware you can do everything needed without opening
up the TripMate and breaking any seals, and keeping the unit stock.

Why bother on an out of warrantee unit?  Resale for one.  Compatibility
for another.

Compatibility?  Sure!  Let's say you want to use it for an 'event'.  A
parade.  But you need 2 or 3 units.  You think anyone in their right
mind would loan you a unit to take apart and mod?  Or, consider if
you had just your unit, but for one reason or another, it goes out of
service.  You can take a borrowed unit, plug it in and use it.  Not
so if you depend on 'hardware modified' units.

Mike

I am in Virginia and I have found so far that the best "generic" path has been RELAY, WIDE or RELAY,WIDE,WIDE and this also served well well when I wandered in to Tennessee or N. Carolina. I have yet to see a digi close by that supports TRACE or WIDEn-n. I know that when I had my digi up (and is going back up) I ran RELAY and WIDE and it would recognize both a RELAY and a WIDE in a stations path. I managed to cover most of the lost packets in the network that were not specifically addressed to a specific digi.

I know there was also a campain for the VA digis to start supporting the VA alias, but I have only seen a few that do. Can someone enlighten me and tell me if the newer Kam firmware supports more than 2 alias?

I used to be able to send a message from wa9inf-3, (TCP/IP only WAPRS 2.5.1), to wa9inf, (RF only WAPRS 2.6.1), for conducting occasional tests of different computers. I can't seem to make that work anymore?

Also, I've noticed that UNVERIFIED and VERIFIED users no longer get a listing in the Message List when connecting to any of the servers? I think I did read where they were attempting to cut back on bandwidth by ceasing that listing?

I am almost believing I am not registered any longer? :-)

I am really learning to confuse myself more and more!

Robbie, wa9inf

I have a Tripmate I am going to mod when I get the time. I wasn't going to use a power switch, I was just going to power it up by plugging it in. Any thoughts out there on this?

I am also thinking about putting the TinyTrak inside. I've seen a few that have done this on their sites.

I've done that, and ended up with a very compact and convenient package (with a bunch of wires hanging out of it, but that's unavoidable). However, I also have RFI problems that I've not yet managed to stop, despite liberal use of .01 caps, ferrite and metal tape to attempt to shield the plastic backshell of the Tripmate. I'm nearly at the point of redoing the entire unit with the TinyTrak in a separate, RF-tight enclosure. . .

I put the TT2 inside two Tripmates. Works great. I did the auto-start mod, I'm also powering the Tripmate using the TT2's regulated +5 volts. When you do so, make sure you don't install the 78L05, but replace it with a "regular" 7805. You can cool that one by putting it under a screw on the aluminum plate that separates the GPS unit from the battery compartment.

In addition I installed an external antenna, a $30 model from Digikey.com. This will absolutely void the warrantee, but it allowed me to mount the TT2 and all your APRS setup invisibly under the fold-away rear seat of my VW Golf. A must when living in the city (unless you want some idi*t to smash your window and rob your gear). You can find the details at http://www.qsl.net/dk7xe/f_tripmate.html .

One of the CONs of powering the tripmate through the 7805 of the TT2 is, that the tripmate will perform better at +6 Volts (locks a lot quicker, or so I am told). However, please don't power your TT2 at anything over 5 Volts, since it will blow the PIC.

I found an amplified GPS antenna for $25 from gpsgeek.com for my Garmin 45
and I have been completely happy with it. it has a right anlge BNC to 16' of
RG-174. It is a patch design and is about two square inches by 1/2 inch
tall. It requires 5 volts for the preamp.

Looks a lot like the multiple port mux that I developed three years ago.
Unfortunately, I needed some support from the authors.

You needed to build a virtual com port driver in Windows itself, not in the
application programs. I've looked for the SDK that Microsoft (used to?) provide
but can not longer find it. Maybe somebody here has a lead and we can
come up with a driver.

Hi Folks,

I am kind of new to this gateway function of aprs. I have a static address as well as a dns name for my box here. I registered my version of APRS at Dayton and received a registration number.

Now to the question. I turned on the functions of the gateway for testing yesterday and I received at message for the aprserver that I am not a verified registered user, internet access only type of message.

Can anyone tell me what needs to be done to open the fro site of this??? Any help would be appreciated.

Angelo

Rendered body type: text/plain

It might be testing the "system" just to see if anyone is watching/listening.

As to the "bottom line" question.... it seems, if "EMERGENCY!" is to have any function then it should be assumed that one can expect another to attempt to discover the nature of the emergency and act appropriately.

IF you have a fully functioning mobile APRS station (gps, laptop, full tnc) AND have the time and ability to completely describe the nature of the emergency, well, that's great. BUT, that emergency might just be a heart attack is occurring and all you can do is hit the pre-programmed "EMERGENCY!" code button and get someone heading your way.

Makes perfect sense to me. What doesn't make sense is that we sit back, monitor the frequency, see the call then chastise the sender for setting off alarms assuming that it's always in error. Have we become so callous and self-centered.....?

Keith, KF4BXT

-----Original Message-----

On the other hand, I really do not understand the point of this test.
Setting the Position Comment to "EMERGENCY!" does not test anything. We all
know that if you set that Postion Comment on a D7/D700 the alarms will go
off in every Kenwood in "earshot". But so what?

Bottom Line: it is not clear what one is supposed to do if the "EMERGENCY!"
alarm goes off........

WE don't have to send anything. WE just have to initiate a response to "an
unknown type emergency". It happens often enough in the real 911 world that
they have protocols developed to handle those type calls. You usually send
a joint police and fire/rescue response with fire/rescue staging, usually
right around the corner, until police can check first for security reasons.
You respond for "worst case" scenario.

What there probably needs to be is some sort of user feedback device that
will initiate a local alarm at the station sending the "EMERGENCY!" packet
so they're alerted that one has been sent. I'll grant that in most cases it
has either been a test or inadvertent. There probably needs to be a way to
"retract" such a message just as easily as there is to send it, especially
for the "dumb" trackers.

Keith, KF4BXT

-----Original Message-----

Pretty good story. However, you mentioned emergency and not knowing and
then you mentioned it as a crash, so you knew.
Would you send a team out, unprepard in regards to walking up to a bear
pooping in the woods? <G> Or walk into a forrest with trees falling in the
woods. What would you send? Swat team, fire, medical, police, Poo-Bear? <G>
I see what you mentioned all the time....it's hard to be a 911 dispatcher!

Yes, but having your position marked on the screen also helps if you can't tell anyone where you are. And by selecting "EMERGENCY!", it will definitely get someone's attention of your exact location. You need to use ALL of your resources available when you are in an emergency situation.

73s,
Eric KF4OTN

Hi Eric,

You could look at your GPS and give the coordinates.

Now let's be honest. I will admit that I don't look at my screen
much on the APRS Gate nor APRSDat 'puters.

I can however hear the two meter, 70 cm and 10 meter club
repeaters, ECARS, MM Net, 40.50 MHZ, 53.30 MHz ,
121.5 MHz and 243.0 MHz from anywhere
in the station.

How many out there in APRS land stare at the CRTs to look for
emergency messages?

Yes, but having your position marked on the screen also helps if you
can't tell anyone where you are. And by selecting "EMERGENCY!", it
will definitely get someone's attention of your exact location. You
need to use ALL of your resources available when you are in an
emergency situation.

I think in a real emergency, you should get on
the voice radio and used the well known Mayday,
Securitie or PAN as the siuations dictate.

That's what i'd do!

Well, I don't know. I have the screen on my APRS station up and
running 24/7. What if someone only has a 40 meter mobile unit in
their vehicle and just a 2 meter tracker? I say use ALL your
resources because at my station I monitor the local 6 meter repeater
OR I monitor HF. The only 2 meter radio I monitor is APRS. I
believe that others may be in similar situations or not even have a
radio inside at all and be running APRS off the internet. It sounds
as if your station is very well equip for handling comms, but some
aren't. If I'm in trouble, I'm going to try to alert as many folks
as possible that I'm in grave danger and need some help. My luck, no
one would be monitoring the repeater!!! :)

I have more questions, but I'll send them in a second email to keep
the subjects separated...

40.50 MHz (36F3) is the Army Air Corps (man it's good to
see the ole wing and prop back) guard channel.

That is WA4MJF-1 which is an APRSDAT station. It send info
to the satelite radios (D-7 etc) so that they can work the
birds that are easy to work without a complex skyhook.

You can find more info at www.TEARA.org

What exactly do you have running there at your station?!? I see sats
and DX information on SATS and see the bullitens that you have
running. Very impressive.

Also, what is 40.50?!? I recognized all the other frequencies but
that one.

To have any validity, it must be reacted to, false alarms must be minimal, retractions must be easy, and the act of sending should independently initiate an audio and visual alarm at the sending point.

I fly with CAP and although we usually fly with our DF system on 121.5 (emergency), we also check 121.5 on the comm radio at the end of every flight to verify that our landing didn't set off our own beacon!

Subject: [aprssig] Re: What's with EMERGENCY MESSAGES???

(Embedded image moved to file: pic32036.pcx)
It might be testing the "system" just to see if anyone is watching/listening.

As to the "bottom line" question.... it seems, if "EMERGENCY!" is to have any function then it should be assumed that one can expect another to attempt to discover the nature of the emergency and act appropriately.

IF you have a fully functioning mobile APRS station (gps, laptop, full tnc) AND have the time and ability to completely describe the nature of the emergency, well, that's great. BUT, that emergency might just be a heart attack is occurring and all you can do is hit the pre-programmed "EMERGENCY!" code button and get someone heading your way.

Makes perfect sense to me. What doesn't make sense is that we sit back, monitor the frequency, see the call then chastise the sender for setting off alarms assuming that it's always in error. Have we become so callous and self-centered.....?

Keith, KF4BXT

-----Original Message-----

On the other hand, I really do not understand the point of this test. Setting the Position Comment to "EMERGENCY!" does not test anything. We all know that if you set that Postion Comment on a D7/D700 the alarms will go off in every Kenwood in "earshot". But so what?

Bottom Line: it is not clear what one is supposed to do if the "EMERGENCY!" alarm goes off........

I'd do that as well as hitting the EMERGENCY beacon on my D-700.

  I might be out of my usual stomping grounds and not able to find an active repeater (IE with someone
monitoring and willing to respond) in a timely manner. And for someone really out in the wilderness,
there's also a possiblity for the signal to be picked up by one of the APRS Sats.

  Also, the beacon could be going out while I'm busy adminstering first aid, evacuating casualties,
directing traffic around a hazard or performing some other function.

  In a true emergency, I'd be "gangloading the switches" and using any and all available means
neccessary to get help ASAP.

  Is the EMERGENCY fucntion a replacement for voice? No, but it has the potential of being a useful
supplement.

I still think we are missing the point here. What EXACTLY does the Position
Comment of "EMERGENCY!" mean?

It could mean anything from the sender him/her-self being involved in a
serious accident (I understand that really happened in MD once) to someone
marking the location of an accident to someone testing their tracker....
That sure is a wide diversity of meannigs. If "EMERGENCY!" mean everything,
it means nothing ....

Keith said: "As to the "bottom line" question.... it seems, if "EMERGENCY!"
is to have
any function then it should be assumed that one can expect another to
attempt to discover the nature of the emergency and act appropriately."

I would agree to the above if there was some common understanding that
"EMERGENCY!" was equivalent to "MAYDAY", but it is not. I do not believe we
can "assume" that "EMERGENCY!" means anything. The spec is silent on this
question. There is no commonly acceptable protocol. I am not saying there
should not be common protocol, on the contrary, I believe there should be!
Right now the "EMERGENCY!" Position Comment sheds little, if any, light and
only causes confusion. That is the whole point ... and maybe that is the
value of the recent test.

Another bottom line question: If you caught a packet with the Position Comment (perhaps the Kenwood lingo for this feature says it all -- it is a position "Comment") would you feel comfortable taking the responsibility to call 911 with that information? Any 911 mavens out there want to offer an opinion as to what kind of response the typical 911 operator would offer to the following: "I just got a message on my ham radio that says there is an emergency at 40 degrees 8 minutes North and 74 degrees 58 minutes west .... Who is involed in the emergency?   I really don't know.... What is the nature of the emergency? I really don't know ... Should you send a police car? I really don't know ... An ambulance? I really don't know ... A fire truck? ...."

Also, I can't let it pass that this discussion is inspired by some cavalier attitude. Rather it is inspired from a desire to promote precision. As a post-er recently mentioned, International aggreements going back decades already give us standard protocols on this question. Maybe we should HAVE (past tense, with all those Kenwoods and dumb trackers out there the horse is WAY out of the barn on this one) considered these questions before the "EMERGENCY!" position comment was carved in stone with no real meaning ....

I believe the that Position Comment of "Emergency!" means that there is an emergency at the location prescribed by the lat/long in the beacon text. Some sort of contact needs to be made to the owner of that station whether it be an APRS message or some sort of law enforcement response. When I work as a Telecommunicator for the County E911 central comm. center, any calls that are "unknown emergency" gets an automatic response by the police department or sheriff's office. It doesn't really matter if it is a cell call, a 911 hang-up, or a child playing on the telephone.

If the person has the ability to also include some information on the emergency, they should do so in the status text or by bulletin or message. It would be nice to include a voice frequency in which they are monitoring if possible. This would clear up some issues as to the type of emergency, but generally, most emergencies get a similar response so it doesn't really matter...

That would work on windows platforms.
The protocol that I proposed is relatively simple, and allows plenty of
room for expansion.

Maybe they're not set up for voice. If I'm having a heart attack, I'm
probably not in a condition to change a radio over to a local repeater and
get enough breath to make a voice statement. You've not been in respiratory
distress, under real personnel duress, or responsible for responding to
those who are having real emergencies (that is being an EMT or Paramedic)
have you?

I can understand the thoughts you are having, it's just I don't agree with
your logic right now. And it's okay to disagree.

Again, if it's a dumb tracker it may very well be using a GPS that has no display. Remember, no display in the vehicle, no immediate access to the transmitter, and quite possibly no physical ability or the time to reconfigure radio equipment to get a voice message out.

Think of a car jacking. Think the car jacker would give you the time to send a voice "mayday" message out?

In APRS, such an emergeny is supposed to ring bells and make a such nuisance that no one will miss it. Even someone in the other room will be alerted to the ruccuas. APRSdos begins beeping and then redraws the map centered on the emergecny... The noise wll not go away until the operator acknowledges the emergency by selecting the Emergency station, or by hitting OPS-CANCEL

On Tue, 11 Jun 2002 frastephen@comcast.net wrote:

> I still think we are missing the point here. What EXACTLY does the
> Position Comment of "EMERGENCY!" mean?

It means someone transmitted it. And that he selected it from a menu of
1 out of 7 preformatted 10 character words.. The sender clealy thought
that the single word out of the 7 possible conveyed his needs at the
moment.

> ...I do not believe we can "assume" that "EMERGENCY!" means anything.
> The spec is silent on this question. There is no commonly acceptable
> protocol.... Right now the "EMERGENCY!" Position Comment sheds little,
> if any, light and only causes confusion. That is the whole point ...

I donno, the above definition seems pretty clear. Now step two of any
reasonable receipent is to take additional steps to investigate what is
the probably cause and or response. It is only an alert...

> Another bottom line question: If you caught a packet with the Position
> Comment (perhaps the Kenwood lingo for this feature says it all -- it is a
> position "Comment") would you feel comfortable taking the responsibility to
> call 911 with that information?

Not at all. But I would begin to investigate... to alert others, to check
other frequenceis in the area, to see if someone is nearby, to exhaust
other possibilitites..

> Anyone want to offer an
> opinion as to what kind of response the typical 911 operator would offer to
> the following: "I just got a message on my ham radio that says there is an

> nature of the emergency? I really don't know ... Should you send a police
> car? I really don't know ... An ambulance? I really don't know ... A fire
> truck? ...."

If after investigation you feel it is necessary to call 911 with the
information you have available, then you give then the information you
have. Not much else you can do...

> Also, I can't let it pass that this discussion is inspired by some cavalier
> attitude. Rather it is inspired from a desire to promote precision. As a
> post-er recently mentioned, International aggreements going back decades

> (past tense, with all those Kenwoods and dumb trackers out there the horse
> is WAY out of the barn on this one) considered these questions before the
> "EMERGENCY!" position comment was carved in stone with no real meaning ....

Pick another word. There are 3 bits. There can be 7 words and they can
be 10 characters long.. We sollicited on the aprssig for what should
those 7 words be. The result is what came out of that discussion. There
is not much else that can be encoded in just 3 bits...

The current words encoded in those three bits are:

Off duty
Enroute
in service
Returning
committed
special
priority
Emergency

In APRSdos the last 4 are shown in different colors ending in Red and the last two evoke a map focus onto the sending station but only the last one sets off alarms...

Rendered body type: text/plain

If I were pretty sure that it wasn't quite so easy (apparently) to accidentally transmit "EMERGENCY!" then yes, I'd have no problem phoning it in and explaining. You see smoke pouring out of the back of a neighbors house....you either run over there and attempt to check it out and/or first call 911 for a fire truck. Turns out, the wife is lighting the grill for the first time to BBQ and it's just that. Err on the side of safety.

Now, one thing that might very well pose a problem is giving raw lat/lon coordinates. I'm not sure many 911 operators would have the knowledge or resources to convert that into a street location.

This brings up another idea. "EMERGENCY!" maybe ought to trigger another canned message comment giving the description of the vehicle that it's installed in. Scenario: "EMERGENCY!" packet is seen on APRS. We've got a callsign, coordinates (hopefully it's a gps tracker), and by looking on a street level map on APRS we can have a rough "detailed" location. The automatic emergency status packet could then tell us it's a green Ford Explorer, tag xx1xx. Maybe you could tell that operator is diabetic or heart patient if it's been a recurring severe problem.

A couple of us have already shared what a typical response to an "unknown type emergency" would be. It's not that uncommon for them to receive something like that. So common in fact that all agencies should have dispatch protocols in place for just such a response. Just think of those little pendants targeting the elderly that live alone. They get in trouble, they just push the button and the receiver automatically dials 911 to summon help. No voice transaction took place.

Now, the kicker in all this is the proven or disproved reliability of such APRS information. If one jurisdiction continues to get false alarm reports from the APRS system or a particular operator, then there could be negative ramifications, which are entirely justified. Would they refuse to respond? No, of course not, their liability exposure would skyrocket if they didn't. Could they fine the instigator of the false alarm? Sure, it's done everyday after enough of them.

Yes, it's probably a statistical fact that most of the "EMERGENCY!" messages transmitted on APRS have been in error. But they've been spread out all across the WORLD and they've made up a very minute percentage of total APRS packets transmitted. Again, I say, err on the side of safety.

Keith

Another bottom line question: If you caught a packet with the Position

Comment (perhaps the Kenwood lingo for this feature says it all -- it is a position "Comment") would you feel comfortable taking the responsibility to call 911 with that information? Any 911 mavens out there want to offer an opinion as to what kind of response the typical 911 operator would offer to the following: "I just got a message on my ham radio that says there is an emergency at 40 degrees 8 minutes North and 74 degrees 58 minutes west .... Who is involed in the emergency? I really don't know.... What is the nature of the emergency? I really don't know ... Should you send a police car? I really don't know ... An ambulance? I really don't know ... A fire truck? ...."

Someone has been sending an emergency beacon for days, according to another poster. Gee, is anyone paying attention to it? I noticed another post to ask if anyone knew who the guy was and contact him to shut it off! Maybe he can't! Who knows?

Thanks Bob for your thoughts and a bit of the history. The polling of the SIG for the use of those three bits is before my time in APRS, so thanks for explaining a bit of the process.

Your words helped me to understand my own confusion in all of this, I suppose. The Position Comment of "Emergency!" is an ALERT, but it is not, by definition, a REQUEST for help or assistance.

I could see someone (the sender) using this with the intention to ALERT others of an "emergency" situation that requires no action on the receivers part (pointing out the location of an accident, the wild fires we are seeing in the Southwest and New Jersey these days, etc) ... the problem is that it might, and there is no way to tell the difference.

In a certain sense, the current "Emergency!" and "Priority" Position Comments in APRS are similar, it seems, to the precedences of NTS standard message forms. Unfortunately, in the case of a dumb tracker, you get a PRECEDENCE with no MESSAGE.

Perhaps, there is a need for a standard APRS Distress protocol. If someone wanted to use APRS for a MAYDAY call (not just an alert, but a request for assistance -- and I understand that this would probably be a last resort and not a primary vehichle for sending a distress signal), what should they do?

Thanks Keith for the reponse..

From: "Keith Kotch" <kkotch@cfl.rr.com>

> If I were pretty sure that it wasn't quite so easy (apparently) to
> accidentally transmit "EMERGENCY!" then yes,

This is one of the problems, I suppose. The only other time I received an EMERGENCY! Position Comment led to a lot of useless driving around and a wild goose chase. And given that these packets can be propagated literally around the world via Internet only compounds the impact of false alarms.

> This brings up another idea. "EMERGENCY!" maybe ought to trigger another
> canned message comment giving the description of the vehicle that it's
> installed in. Scenario: "EMERGENCY!" packet is seen on APRS. We've got
a
> callsign, coordinates (hopefully it's a gps tracker), and by looking on a

> automatic emergency status packet could then tell us it's a green Ford
> Explorer, tag xx1xx. Maybe you could tell that operator is diabetic or

> heart patient if it's been a recurring severe problem.

Interesting idea! As I posted previously, the EMERGENCY! position comment
gives a precedence to a message, with no message attached!

>
> A couple of us have already shared what a typical response to an "unknown
> type emergency" would be. It's not that uncommon for them to receive

True, but when the old lady hits the panic button she intends to communicate
to the world she needs assistance -- not necessarily so to the rogue
EMEREGENCY! packet.

I've been watching all the hoopla for the last several days over Emergency
Messages. I have a question that I'm sure I'm not the only one that needs
to have answered.....How Do You Send An Emergency Message in the following
conditions?:

1. Dumb tracker...2m radio, KPC-3, and a GPS with no display.
2. KWD D-700/7 and a GPS with no display
3   KWD D-700/7, GPS with no display, and a laptop running WinAPRS or
equivalent software.
4 Alinco DR-135 with built in TNC and a GPS with no display
5. #4 with a laptop
6. A home station running WinAPRS or equivalent software
7. #1 again but with a Tigertornics box instead of the KPC-3

That pretty much covers all the ways APRS is used locally.

not sure, but doubt it, and there is no front panel to set the message.

The only way to send a message that triggers these alarms is within the Mic-E format, and of the above choices, only 2 definitely does (just not sure what the tigertronics puts out). As I wrote when the story this was going to happen first broke, this may be an oversight in the spec. Perhaps there should be an emergency trigger that can be placed in any message, for example !e! or !911!(I'd allow !E!, no need to make it case sensitive).

Then at least any of the above with a computer could be made to send it. Of course, the user programs could also be modified to send the posits for emergency messages in the Mic-E format so no further protocol spec would be needed. The advantage of another packet would be more text could be included that the Mic-E protocol allows at the end.

If any new construct is agreed to I'll modify the emergency cgi of findU to accept it as well. In fact, if you really have the need, if you place this in any text string of a program:

/M7/

and it will appear on the page, but of course it will not trigger any other program, nor is it easy to remember. (This is the trigger for converted Mic-E packets.)

Or as a TEST and clearly marked as such.

But have you ever tried to send an Emergency on the Kenwood? When you dial in the EMergency code, it asks ARE YOU SURE? That seems pretty well protected. First you have to select menu, then you have to select comment, then you have to dial in emergency, then you have to hit OK, then you have to answer the above question.

If somone makes a mistake doing all that, then he is an emergency....

Hi,

I am new to APRS and I am in the process of setting up a APRS digipeater on 144.390.

For portable operations, does anyone know of a small single channel radio? I am looking for something with about 5 Watts out for a homebrew box using the TiniTrak device and a Garmin handheld GPS.

Thanks,
Adi

The only things that can send "EMERGENCY!" are a Kenwood D700 or D7 or Mic-E or Pic-e or anthing else that uses the Mic-E protocol. I think only the Kenwoods have the "are-you-sure" layer of protection.

Probably the false alarms are coming from the other Mic-E's and Pic-e's that have no protection from an inadvertant setting. We thought about accepting the word EMERGENCY spelled out from any APRS MESSAGEING device, but each time it comes up, it all boils down to the same kind of bickering over what constitutes an "emregecny" and thus impossible to get agreement on it...

I think you're thinking about building a tracker not a digipeater...you dont
need a gps for a digipeater.  Probably the best radio, and easiest to find,
would be a 2m HT.  If you can afford it, the KWD d-7 is a good way to
start...has a built-in tnc.

I am using an old commercial rig for the digipeater. Otherwise the
FT-1500
would probably be my choice.

I am looking to build a portable tracker using tinitrak and some sort of
small and inexpensive HT type radio. Low power consumption and inexpensive
are a must. Are there any well designed circuits/kits for a low power
single channel 2m tranceiver?

Yaesu FT-1500 in use at my digi in Seattle. (http://map.findu.com/sea)
Also works well as a mobile. Makes 50 or 60 watts of output and can be
throttled back in several steps, one of which is 5 watts. I got mine for
$129.00. ($149.00 - $20.00 coupon) at the local ham shop here in Seattle.
Not rock bound. Hears very well. Almost bullet proof as far as intermod
goes. It replaced an old Azden PCS-4000 up there and almost doubled the
digi's usable range due to it's lack of intermod issues.

The digi is located at the KCTS-TV tower in Seattle, WA. The hilltop is
home to three analog and three digital television stations. All stations
operate at full power with the exception of one 40kw DT. There is a 100kw
and a 6kw radio station. All within 200 feet of each other. Plus the usual
compliment of two-way/paging/public-safety junk. The radio works very well
in this enviroment.

How do stations appear on findu.com? When I run aprsd it connects to some
other hub sites. I understand this is the IGate function. Will sites
learned through the digipeater automatically be distributed and eventually
appear on findu.com? What's required to have the actual digipeater appear
on findu.com?

Sorry if this may seem trivial. But I have yet to find comprehensive
information on APRS. I am pulling together a lot of bits and pieces from
everywhere, but I have almost zero info on the IGate thing.

Adi

>How do stations appear on findu.com?

Pure magic ;-)

Actually, findu connects to the APRS Internet System just as you do,
and all the data that is received gets parsed by a Perl program and
stored in a MySQL database (current size 20 GB, mostly data generated
in the last 90 days), when you request the page a program called a cgi
(common gateway interface) script written in Perl queries the
database, builds the page, and the Apache web server sends it to you.

As long as there is an IGate in range, yes.

>What's required to have the
>actual digipeater appear on findu.com?
>
Send a beacon out using the BTEXT function of the TNC, for an example
see:

http://www.findu.com/cgi-bin/find.cgi?call=kd4bbm-6

>Sorry if this may seem trivial. But I have yet to find comprehensive

Have you looked at Stan's books on APRS, available from the ARRL?
There are lots of good sites that cover various aspects, but the topic
is so large it really does take a book even do a decent survey of what
is out there.

>I am pulling together a lot of bits and pieces
>from everywhere, but I have almost zero info on the IGate thing.

There is some old but still viable technical stuff on vm.aprs.net,
papers that describe the basic principles. There isn't much out there
on the subject though, other than a few how-tos and such.

363. [aprssig] Great Servers for APRS+SA and WinAPRS internet

From: "hasan schiers" <schiers@netins.net>
Date: Tue, 11 Jun 2002 18:40:58 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-84440-2002.06.11-19.17.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Thanks to Dick, KB7ZVA, I am including two files that you can cut and paste into either WinAPRS or APRS+SA to give EXCELLENT connectivity to the internet for aprs. Paste them into your current file (name is different for the two programs) and comment out your old stuff. These use the javaAPRS servers and they work great!

For WinAPRS:

```
================ (Start below at # which signifies comment)

# Just copy and paste this file in notepad...
# Please use this replacement for your aprserve.txt
# It is designed to connects to the javAPRSSrvr Servers
# Make sure there is a <tab> between fields

# Full APRS feed:

aprswest.net 10152 Full feed APRSWest
ahubeast.net 10152 Full feed AHubEast
ahubca.net 10152 Full feed AHubCA

# These are the regional feeds:

aprswest.net 14579 APRSWest Western States coverage
ahubeast.net 14579 AHubEast Eastern States
ahubca.net 14579 AHubCA California

# This is a special port just for ALL weather stations:

aprswest.net 23 Weather Server ALL WX and CW Users

=============== (end with last blank line)
```

Notes: WinAPRS requires a reboot to read in the new serverfile. The file is located in the \WinAPRS directory   (where winaprs.exe is)

Comment out with a # the servers you are not interested in. If you only want full feed servers, then you only need the first 3 listed in the example above.
****

For APRS+SA:

```
================(Start below, comments start with ; (semi-colon)
;
; Comment Lines begin with a ;
; javAPRSSSrvr Servers from kb7zva
;
;Full Feed Servers
;
aprswest.net:10152
ahubeast.net:10152
ahubca.net:10152
;

==============(End with last line with semi-colon)
```

Notes:

The aprs server file is located in: \APRS+SA\data   directory.
APRS+SA will load the file directly, without shutting down the program and restarting. All you have to do is close the internet connection and when you re-open it, the new list of servers apprears.

Notice that the syntax for APRS+SA is different than WinAPRS. WinAPRS uses TABS for separators, while APRS+SA uses a colon with no spaces.

Setup > Internet > you'll see the entries in a drop down menu.

****

Hope this helps ...it sure did me. 73 and a big thanks to Dick and the person that wrote the new server code.

364. [aprssig] How to capture serial data in LINUX

From: "Andrew Rich" <andrew.rich@bigpond.com>
Date: Wed, 12 Jun 2002 10:51:09 +1000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-84442-2002.06.11-20.27.33--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

LINUX School is IN !

Some people may not know but you can do this under linux:-

1. Hook up your TNC to the serial port
2. This will sometimes be /dev/ttyS0 (com1) /dev/ttyS1 (com2)

I found I needed to turn echo off on my com port

```
  stty -F /dev/ttyS0 -echo
```

Watch packets on the screen

```
  cat /dev/ttyS0
```

Capture packets to a file (append is ">>" , background process is "&")

```
  cat /dev/ttyS0 >> aprs.log &
```

Watch packets on the screen from the aprs.log

```
  tail -f aprs.log
```

Filter out just VK4 stations

```
  tail -f aprs.log | grep "VK4"
```

Filter out PCSAT packets

```
  tail -f aprs.log | grep "W3ADO"
```

Extract VK4TEC out to a log

```
  cat aprs.log | grep "VK4TEC" >> vk4tec.log
```

Re-direct packets out another TNC

```
  cat /dev/ttyS0 > /dev/ttyS1
```

Because LINUX is so stable, makes for a good logging platform, and with the power of shell programming you can do most anything.

On 6/12/02 10:51 AM, andrew.rich@bigpond.com (Andrew Rich) wrote:

>Filter out PCSAT packets

actually extract is the better term, any line containing W3ADO will be printed. Of course, since you really want lines beginning with W3ADO or PCSAT, fortunately grep understands regular expression...you can use this for a more selective test for PCSat packets:

```
   tail -f aprs.log | grep "^W3ADO"
```

regex is a bit of a steep learning curve, but the power is absolutely amazing after you have some concepts mastered.

telnet can allow you to see the live stream, not just the log or tnc data:

This line prints out all the live packets that do not start with K, W, N, or A...a quick and very inexact way to remove US licensed stations from the feed:

```
telnet second.aprs.net | grep "^[^KWNA]"
```

lots of internet sources to learn about regular expressions if this grabs your interest.

>with the power of shell
>programming you can do most anything.
>
And everything else can be done with Perl, MySQL, and Apache!

Message-ID: <LYR842-84445-2002.06.11-21.37.36--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PCsat is now into its 3rd day of full sun and normal ops, and we are seeing a few APRS users on each pass. On the late afternoon pass, I saw WA1KAT, K8TPH and W3AFE. On the after sunset pass I saw XE2KH, KH6JJD (on a barefoot D7) N2JXP AND N9IDH-9.

During a pass, I just go sit in my car with my D700, watch who is on, exchange a few mesages and enjoy the evening air. I notice just about 100% of my packets are digipeated, and I saw at least a dozen from the barefoot D7. There is no congestion at all. Its wide open..

PCsat is going over everywhere on earth this week 3 times centered on Sun Rise and 3 times centerd on sunset. Enjoy...

P.S. Unrelated, today I worked several stations on UO14 using only the 5 Watt HT and a 19" whip on the uplink... (30 deg or so pass)....

> emergency messages?

In APRS, such an emergeny is supposed to ring bells and make a such
nuisance that no one will miss it.  Even someone in the other room will be
alerted to the ruccuas.  APRSdos begins beeping and then redraws the map
centered on the emergecny...  The noise wll not go away until the operator
acknowledges the emergency by selecting the Emergency station, or by
hitting OPS-CANCEL

Maybe bad satellite geometry.

Yes, SA has been turned off since 5/1/2000. Arguably one of the very
FEW good things Slick Willie ever did while in office.

You can usually find a used radio Shack HTX-202 2mtr HT on eBay or at a
Hamfest for around $60-$75.  With a 13.8v power source it gives you 6
watts out, the receiver is hot except for intermod susceptibility, and
the receiver doesn't draw a ton of power.  Or you could build a
Hamtronics single channel RX/TX pair, but they'll cost you more $ after
you buy the xtals.

I am using an old commercial rig for the digipeater. Otherwise the
FT-1500
```

would probably be my choice.

I am looking to build a portable tracker using tinitrak and some sort of

small and inexpensive HT type radio. Low power consumption and
inexpensive
are a must. Are there any well designed circuits/kits for a low power
single channel 2m tranceiver?

Rendered body type: text/plain

Just a quick code snippet.... untested... compiles error free. Pic Basic
Pro can be had for free at www.melabs.com
Wes

```
' Smart beaconing for the PIC processor
' Wes Johnston, kd4rdb
' Hook this to the same GPS which is connected to your kenwood radio via a Y
cable.
' The PIC processor will harvest GPRMC sentences from your GPS.
' When this SmartBeacon device decides the time is right to beacon, it will
toggle
' the kenwood's beacon mode causing it in turn to beacon your position.
' Plug the output of this unit into the serial connector on the kenwood
radio.
' Thanks Steve Bragg KA9MVA and Tony Arnerich KD7TA.

' Yet untested, but compiles error free in Pic Basic Pro.

' Later Revisions may include ability to change SB parms on the fly, Auto
' dimming the Kenwood display brightness and GPRMC error checking.

' Define all variables
beacon_secs   var word
dif    var word
secs_since_beacon  var word
speed    var word
turn_min   var word
turn_slope   var word
turn_time   var word
beacon_fast   var word
beacon_stop   var word
low_speed   var word
high_speed   var word
old_heading   var word
heading   var word
turn_threshold   var word

' Init all values
beacon_secs  =60
dif    =0
secs_since_beacon  =0
speed   =0
old_heading  =0
heading   =0
turn_threshold   =0

'Smart Beacon Parms
```

```
turn_min  =14 ' Min turn angle threshold for corner pegging
turn_slope  =255 ' Min turn angle threshold for corner pegging
turn_time  =5 ' Time between corner peg and any beacon (SEC)
beacon_fast  =60 ' Fast Beacon Rate (SECONDS)
beacon_stop  =30 ' Stopped Beacon Rate (MINUTES)
low_speed  =2 ' Low speed threshold (MPH)
high_speed  =60 ' High speed threshold (MPH)

mainloop:

' update our seconds since last beacon timer once a second, regardless of
gps data rate
secs_since_beacon=secs_since_beacon+1

' check to see if we need to beacon yet
if secs_since_beacon>beacon_secs then
 secs_since_beacon=0
 old_heading = heading
 serout2 porta.1,84,["BE 0",13]
 pause 500
 serout2 porta.1,84,["BE 1",13]

You may also want to check out:
<http://www.rimboy.com/rimdistro/rimigate/>
Sean has made a linux boot disk with the APRSd server software all fitting on one disk. A 486 with a floppy, a serial port and a NE2000 or 3c509 network card and your in business. I am running one at my house which is in a dead zone and out of range of any nearby digis. Nearby travelers still get into APRS-IS from here.

Rendered body type: text/plain

A good friend of mine just got a new-to-him used laptop, with only one serial port. He wants to use it for mobile APRS, and I'm thinking there might be a way to connect the TNC through the serial port, and connect the GPS through either the parallel port, or else the PCM/CIA (or whatever that abbreviation is) port.

Any help from the list?

Thanks,
Earl

Rendered body type: text/plain

APRS in Japan,

The casual observer of the ISS and PCsat downlinks will notice that there is lots of APRS style activity in the USA, Europe, and Australia/New Zealand. But notably absent is the big HAM radio country of Japan. See the live downlink pages:

ISS: http://www.ariss.net
PCsat: http://pcsat.aprs.org

We are finally beginning to see some activity to bring Japan into the worldwide 1200 baud UI digipeating AX.25 packet system via these two satellites and to also join in the worldwide APRS linked communications and tracking system. There is now an active APRS internet gateway JA1YKX operating in Yokohama and also feeding PCsat dowlinks into the APRS system.

To see a world map of APRS acitivy go to this page:

http://www.findu.com/cgi-bin/dmap.cgi

And when the USA map comes up showing all stations on the air, then ZOOM

```
out several times to see the rest of the world activity.   This map is not
very good because it does not show the world outlines, but anyone can set
up a live APRS web page.  See how on Steve Dimse's
http://www.findu.com/new.html

The reason that JAPAN is not on APRS is because they developed a system
ham radio system called NAVITRA for GPS position reporting but since it
did not do all the other things like Messsages and Email, and Telemetry,
and WEB pages that APRS does, it did not catch on...  But now that APRS is
global, maybe it is time to abandon  NAVITRA and integrate them into the
rest of the worldwide system...

Just a thought...

You can specify the world map, here is a view of that part of the
world:

http://www.findu.com/cgi-bin/dmap.cgi?zoom=1&offsetx=934&offsety=145&
map=world.mp&scale=0.06&last=24

```
Serial PCMCIA cards are available, but kind of pricey.  Be aware too
that PCMCIA slots only have ONE interrupt, so if you get a 2-channel
serial card, it will SHARE the interrupt.  (Real Time Devices in St
College
PA is one of the places that sells serial PCMCIA cards.)

Not a big deal for windows drivers, but for 'dos compatible' interfaces
it's a really big deal.

Also be aware that a LOT of 'setups' will try to put PCMCIA com
ports out past the first 2.  You may have to juggle the internal serial
ports to make at least the first PCMCIA com port appear in a 'generic'
sense so that a DOS program can pick it up.  This is usually a problem
on laptops that have a serial port and an IR port.  The original setup
will usually default to them being COM1 and COM2 and using IRQ4
and IRQ3.  If possible, either disable the IR, or make it one of the
ports that 'shares' IRQ4 with COM1 serial port, then the PCMCIA
com port should 'drop in' at the usual COM2 address with IRQ3, and
work with generic DOS utilities.
```

Do you have USB available? If not perhaps you could acquire a USB to PCMCIA
card and then add USB<>Serial adaptors? I use 5 of them on my radio machine
here at the house and it all works fin. Beware however that not all comms
programms can address more than the first 4 serial ports. Some of them can't
talk past 2.

```
I setup aprsd on my Linux box. BTEXT in the attached TNC has been
configured. Also, there is a "NetBeacon" setting in "aprsd.conf" which I
set.

How do I go about connecting this digipeater to an IGate to sent my
information and information heard on RF to the world? My aprsd connects to
anotherIGate but doesn't send anything.
```

There is also a "servercall aprsdXXX" what would I set this to?

Just to clarify, I am in Northern Ontario, the nearest APRS digipeater is about 450km away. I won't be reaching that one over 2m. So I would like to get a local aprs digipeater started that is connected to the rest of the world.

Thanks. I didnt have much time when I first wrote that. The one thing I wanted to post in that message was the "world" map view that shows everyone live at once. Just to get the big picture.

Since we lost www.APRS.NET, I have not found a suitable replacement. I had one for a while, at some university, but it seems to be down now...

ANy good ideas? Thanks...

Oh, And I did check your FINDU.COM site of "new things" before I made that post and didnt find any reference to these maps (or overlooked it)...

Thanks

Bob

OOps, Sorry, we updated the TOCALL lists back in May, I assumed that
UIDIGI would use one of the APN codes set aside for nodes and digipeaters.
I would suggest APNUxx... Here is the list.. with that addition:

```

Speaking of which, does anybody know of a source of PCMCIA <--> USB cards that
are NOT of the CardBus (wide data path) variety?  I'd settle for one that would do
both CardBus (31 bit) and PCMCIA (16 bit) interfaces.  It'd breathe new life into my
Compaq Aeros.

: emergency messages?
:
: 73 de Ronnie

I think you are getting closer to the point where aprs may have a slight
advantage over telephony, Ronnie.  Yes few are able to monitor to see a text
call for help and likewise there are times one can't generally devote all
their attention to listening to the radio and many times the radio will be
required to turned off or the volume lowered. An APRS application's alarm
will allow you to go about your business quietly and notify you of an
emergency the way your telephone notifies you when some wants to speak with
you.  While it's helpful to know the nature of the emergency to get the
proper help quickly as possible but, to address Keith, KF4BXT's comments "
might be testing the "system" just to see if anyone is watching/listening.",
also it's helpful to know that the emergency transmission is a test
requiring NO response   Sometime back I discovered that the emergency
response activities of AR are known by the public safety and law enforcement
communities is at a level  I never realized and getting back to the post
that started this thread, any system that cries wolf once too often doesn't
serve APRS in particular or Amateur Radio in general.--73

How many out there in APRS land stare at the CRTs to look for
emergency messages?

73 de Ronnie

I think you are getting closer to the point where aprs may have a slight
advantage over telephony, Ronnie. Yes few are able to monitor to see a text
call for help and likewise there are times one can't generally devote all
their attention to listening to the radio and many times the radio will be
required to turned off or the volume lowered. An APRS application's alarm
will allow you to go about your business quietly and notify you of an
emergency the way your telephone notifies you when some wants to speak with
you. While it's helpful to know the nature of the emergency to get the
proper help quickly as possible but, to address Keith, KF4BXT's comments "
might be testing the "system" just to see if anyone is watching/listening.",
also it's helpful to know that the emergency transmission is a test
requiring NO response Sometime back I discovered that the emergency
response activities of AR are known by the public safety and law enforcement
communities is at a level I never realized and getting back to the post
that started this thread, any system that cries wolf once too often doesn't
serve APRS in particular or Amateur Radio in general.--73

I seriously doubt you will find one. Just by it's nature, USB is a PCI
device, which means CardBus (which is essentially a 'swapable PCI').

I seriously doubt anyone would take the time and effort to develop a
'backwards link' on the technology. Unless of course it was for a
government project with tons of money available...

Of course, you could make your own PCMCIA card with a processor
on it to do USB, (within the limitations of the PCMCIA bus), write
your own firmware, AND your own protected mode driver that will
allow your processor on the PCMCIA card to 'pass through' enough
to make attached devices 'look like' they are on a local USB...

Buy a new laptop...

Mike

Rendered body type: text/plain

A while back someone posted a request for info on antennas for GPS.

I had found this one quite some time ago, and was going to build it,
but just haven't gotten around to it.

        http://www.geocities.com/CapeCanaveral/3161/gps.htm

Anyone have any feedback on this thing? It looks pretty interesting.
Just gotta remember to insulate it or otherwise protect it since my
Garmins all put voltage on the antenna center pin.

I wonder, how bad would a cap in series right at the antenna feed
point detract from the optimum...

Mike

Apparently, the list is configured so that reply to sender sends a reply to
you only, and reply to all sends a reply to you, the list, and a copy to
the list.

Us chickens didn't set it up that way.

A reply to the sender (at my station) generates just that, a reply to the
sender. A reply to ALL replies to the sender AND to the list in the
"To:" field.

While I have seen it happen in the past where it put a "cc:" entry in
also to the list, I haven't seen that in quite some time here. Or at
least,
I haven't noticed it.

In other words... It ain't broke here!

>
> A good friend of mine just got a new-to-him used laptop, with only one serial port. He wants to use it for mobile APRS, and I'm thinking there might be a way to connect the TNC through the serial port, and connect the GPS through either the parallel port, or else the PCM/CIA (or whatever that abbreviation is) port.

1) A simple solution is to buy either a KPC-3+ or a Paccomm dual-port PicoPacket.

With both of these TNC's, you connect the TNC to the computer, and then you connect the radio and the GPS to the TNC. Problem solved. You only need one serial port on the computer to do this. These TNC's also work with PDA's like the Handspring which also have only one serial port.

2) Another method is to either build or buy an HSP adapter (hardware serial port). This is a device which uses one handshake on your computer serial port to switch between two serial devices, your TNC and your GPS.

Most of the APRS software out there supports the above two methods.

Greets folks:

Anyone know of an easy way to sync an APRSdata machine to keep the time accurate? I'm looking maybe for a GPS via serial setup or something similar. maybe sync'd over a network? I see windows applications (such as AtomTime) to sync with the naval stations for correct time but nothing for DOS.

For the price of a MFJ dataradio (single channel - which I own 3) you can get a yaesu FT-2600 with a serial (DB9) interface and you choice of power levels. A few years ago when 2 meter rigs were higher in price, the MFJ wasn't all that bad a deal. But now a days...... makes better sense to get a regular 2 mtr rig.

I have 4 2600's (2 working as digis 24/7) and they work like a champ. Beware though.... if you have one mounted in your car and try to start it with the 2600 powered up (which you shouldn't do anyway with ANY rig because of the voltage drop) it may scramble your stored memories.

The Yaesu 1500 is also a good deal around $139 bux.

I concur with this... I have both a Kenwood 261 (on my MIC-e tracker) and a
MFJ data radio (on my weather station). The cost is effectively the same but
the utility of the 261 is far greater... Both have been working without flaw
in harsh environments for 3 or 4 years...

That is also the reason that TAPR does not have a radio kit (and for
that matter why Heathkit stopped producing kits). It simply isn't
possible to complete on a cost-effective basis with mass production in
the Far East. The cost of the parts in under 1000 lots ends up being
greater than the cost of the completed radio.

Yes, they did.  And the "Emergency" packet included in the 20 byte
Position comment text these words "TEST test".  Seems pretty obvious to me
it was a test...

> Now  I'm back to Spyder Jim's original comments on indiscriminate test
> distress signals, where anyone monitoring has no clue it's an
> exercise.--73

That is why we need all APRS software to not separate the Position from
the Comment when both are included in the original packet.  And for users
to not just look at the word Emergency without loooking at the rest of the
packet... The origial packet contained 3 bits "111" that signals the key
word "Emergency".  But also in the same packet are 20 bytes of free form
character text.  These bytes said "TEST test"...

405. [aprssig] Smart Beacon changes...

From: "Wes Johnston" <wes@johnston.net>
Date: Wed, 12 Jun 2002 20:00:21 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: "aprs" <aprssig@tapr.org>
Message-ID: <LYR842-84610-2002.06.12-19.37.01--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I was playing with "my rendition" of smart beacon today.. running in quick
basic on a laptop in the car so I could play with it and see *exactly* how
it works. I thought it would be nice if it would beacon once when I dropped
below the low_speed threshold, and when I exit the low_speed if I had been
sitting still for a while - like more than turn_time number of seconds.
That could provide a little hysteresis to keep it from beaconing constantly
when inching up in traffic, but still allows a beacon when you depart a stop

light. What I noticed was that SB would never advertise that I'd stopped my
car until 30 minutes had passed. With dead reconing on, someone observing
me would think I'd travelled a long way in 30 minutes when in fact I was
sitting still. I've marked my suggested changes with ********.

Smart Beacon already does:
Beacon when you turn a corner
Beacon at fixed distance intervals
Reduce beacon rate when you are stopped

With these changes Smart Beacon will:
Beacon when you come to a stop
Beacon when you begin moving again if you have stopped more than a few
seconds.

Wes

```
 if speed < low_speed then
' *************************************************************
  if beacon_secs <> beacon_stop *60 then

I concur with this... I have both a Kenwood 261 (on my MIC-e tracker) and a
MFJ data radio (on my weather station). The cost is effectively the same but
the utility of the 261 is far greater... Both have been working without flaw
in harsh environments for 3 or 4 years...

For the price of a MFJ dataradio (single channel - which I own 3) you can get a yaesu FT-2600 with a serial (DB9) interface and you choice of power levels. A few years ago when 2 meter rigs were higher in price, the MFJ wasn't all that bad a deal. But now a days...... makes better sense to get a regular 2 mtr rig.

I have 4 2600's (2 working as digis 24/7) and they work like a champ.
Beware though.... if you have one mounted in your car and try to start it with the 2600 powered up (which you shouldn't do anyway with ANY rig because of the voltage drop) it may scramble your stored memories.

The Yaesu 1500 is also a good deal around $139 bux.

Wouldn't there be a formula for speed and a formula for position change ?

km/h / x = beacon rate

horizontal movement / x = beacon rate

Andrew

Rendered body type: text/plain

I managed to get hold of HA8BI Lajos and asked him to contact Zsuzsa HG7JMS-9 about her "Emergency!" beacon. Seems that the PIC in her TinyTrak managed to get scrambled and that's why it was sending out the false beacon. They've got it fixed now, so all should be well with the world!

Rendered body type: text/plain

One name for list is aprssig@lists.tapr.org

the other is aprssig@tapr.org

I've noticed that when I reply all with OE if the sender used
the first name I listed I get the sender and the list in the to line.
If the sender used the second name I get the sender
and the list in the to line and the other name of the list in the cc line.

I try to delete the cc most times, but sometimes forget.

My registration is with the first name, BTW.

Wasn't this the topic of discussion before? I though that it was
decided that when you hit the reply button that the LISTSERV would be
setup so that it would go back to the list. Isn't that the reason
for the listserv to have a discussion? You can't have a discussion
replying to just one person. I guess it hasn't been changed,
though...

Just my two cents worth...

73s,
Eric KF4OTN

Rendered body type: text/plain

Ok, I figured out you can't command PS 0 to turn the power off when in TNC mode - appearantly, the TNC intercepts the command and does not pass it along to the radio. When in APRS mode, you can command the radio directly. In either mode, you can send PS 1 twice with a little pause between to turn the radio on remotely. This means that a smart beacon supervisory module could turn on the radio when you got in your car and started to drive.... as soon as you get over 2 mph, the radio would come on. You could also have the radio beacon a while after you get to work and then after, say two hours, turn itself off.

I also noticed that when a station is heard on APRS, the radio publishes a LIST command with comma seperated list of details about the station. This means that we can now publish alternative aprs frequecies using digipeaters and have the radio auto QSY when it's within range of an alternate frequency net. Don't know how many of you remember the discussion a few months ago about a MAN metro-area network.... but this is a damned good shot at it! I need to work on a format to advertise what the customary PATHS are, FREQUENCIES, and BAUD RATES.

I made a mistake in my code... I was trying to send the radio BE 0 and BE 1 when I should have been sending BCN 0 and BCN 1 to toggle the beacon mode.

More to come, I'm sure.
Wes

Wes,

Check my web page, www.jgav.com/ham for the "Change TNC mode" web page (http://jgav.com/ham/tnc_mode.htm). You can change the TNC mode remotely over the serial port. This should allow you to change from TNC mode to RC mode, then you can send your PS 0. Check my web site for more details, but here is the quick nitty gritty (this is an update to what I sent you privately today).

The following table should be displayed with a fixed width font. If the columns and rows wrap oddly, copy and paste the text into a plain text editor to read. To get an explanation of what I mean by RC mode, see the web page.

```
TNC in  To go to        Send this in    Delay to
This Mode       This Mode       UPPERCASE               Re-init TNC?

OFF             APRS            TNC 1           YES
OFF             PACKET  TNC 2 then TC 0         YES
OFF             RC              (not necessary)*
APRS            OFF             TNC 0
APRS            RC              (not necessary)*
APRS            PACKET  TNC 2 then TC 0         YES
RC              OFF             TNC 0
RC              APRS            TNC 1           YES
RC              PACKET  TC 0                    NO
PACKET @        OFF             TC 1 then TNC 0
PACKET @        RC              TC 1                    NO
PACKET @        APRS            TC 1 then TNC 1         YES
```

@ Don't forget to send a Ctrl-C (alt-3 on keypad, hex $03, etc) to get out
of converse mode on the TNC if necessary!
* You can enter any Radio Control (RC) commands while in the OFF or APRS
modes.

This data was the result of some testing between Bob B. and myself a couple
years back.

Ok, I figured out you can't command PS 0 to turn the power off when in TNC
mode - appearantly, the TNC intercepts the command and does not pass it
along to the radio.

Can somebody tell me how to change the tocall in WinAPRS? I was playing
with WinAPRS 2.51 to get a little familiarity with it. (I use another
client, but was trying to help somebody who was using WinAPRS.) It appeared
to have APRSM hard-coded as the tocall.

Bill

Rendered body type: text/plain

I just wanted to share a story about how a blind ham is using FINDU to participate in APRS. Your first thought might be that a mapping program or web site would be very difficult to use and of little use to someone who is blind. A friend of mine proved me wrong. Because the FINDU site describes a station's location in plain text, his screen reader reads this text to him and he can track stations almost as accurately as the rest of us can using a map. He recently used FINDU to track a friend of his as he travelled from the east coast of Canada through Saskatoon and on to Edmonton. It worked great!

Thanks very much, Steve.

Hi,

I am new to APRS and I am in the process of setting up a APRS digipeater on 144.390.

For portable operations, does anyone know of a small single channel radio?

I am looking for something with about 5 Watts out for a homebrew box using
the TiniTrak device and a Garmin handheld GPS.

Thanks,
Adi

The only things that can send "EMERGENCY!" are a Kenwood D700 or D7 or
Mic-E or Pic-e or anthing else that uses the Mic-E protocol. I think
only the Kenwoods have the "are-you-sure" layer of protection.

Probably the false alarms are coming from the other Mic-E's and Pic-e's
that have no protection from an inadvertant setting. We thought about
accepting the word EMERGENCY spelled out from any APRS MESSAGEING device,
but each time it comes up, it all boils down to the same kind of bickering
over what constitutes an "emregecny" and thus impossible to get agreement
on it...

> John, there are apparently two names for this list.
> It has nothin' to do with not knowin' how to use your mail client.
> Get over it and use your delete key!

And besides the LIST will only send one copy. The TAPR lists do dupe
checking and it will send back to the originator an error message stating
something like "the following messages appears to be a dupe of a previous
message sent by APRSSIG and was not sent"...

The only time I ever see two copies is when someone sends me a personal
copy. But that is exactly what one would expect...

Rendered body type: text/plain

Here is how the list is set-up:

REPLY goes to the originator of the message you are replying to, not to the List.

REPLY ALL goes to the List and the originator of the message.

The originator will receive a duplicate message if the replyer uses REPLY ALL. If any other duplicate messages are being generated, then someone is doing something with their email software that results in the dupes; the List software is not causing the problem.

That is all!

This is the only email list I belong to where I have to edit the reply address to send a reply back from where the message came. For example, in this reply from the above message when came from the 'list' when I hit "reply", it wants to send it back to Bob. Bob did not send the message to me, the 'list' did. I had to delete Bob's address and add the 'list' address.I do not understand why the sysops choose to not follow a standard that has been around for ages.
If they would follow the standard, they would end the problem of people hitting the "Reply All" just to get a message to the list without manual intervention. Computers are suppose to make life easy!

The list works exactly as Stan said.

You're splitting hairs, saying a 'reply' should go to the list. Why break
it?
If you want to split hairs, then I could argue that the email forwarder
sent you the message, and 'reply' should only go to that!

The list works.

The list works as Stan said it works.

The list makes sense.

Please don't start this up again until it gets fixed until it's broke...

It really is easy if you understand it.

Mike

Well, the list should be about promoting discussion. If we have to
do something different than "REPLY" to a message for everyone else to
be involved, then it is broken. If you get into a side discussion,
then someone quietly sitting on the sideline trying to learn about
whatever is being talked about won't get the messages! Make sense to
me.

Rendered body type: text/plain

I'm looking for a short discussion listing procedures and suggested set up
on how one might use APRS and maximize band width utilization during FD and
make digital contacts. I'm sure many stations will at least have an APRS
station set up for the demonstration station bonus. I also suspect that due
to the elevated usage there is a higher probability of less data being

moved.

I've trolled Bob's (WB4APR) web site in the hopes of locating a kind of a step by step lead thru targeted at a novice APRS user on how the QSO's might be conducted. On his satellite page, there is a pass schedule which makes space based contacts an interesting possibility.

On Wed, 12 Jun, Bruce & Leigh Coates wrote about Blind hams using FINDU:

> Because the FINDU site describes a station's location in plain text, his
> screen reader reads this text to him and he can track stations almost as
> accurately as the rest of us can using a map.

Neato! There is a very active blind HAM in our area that I have been wanting to get on APRS for years. I just called him to suggest FINDU.COM and he said "Yeah! His wife used FINDU to track him all the way to dayton and back." So I guess I was behind the times...

I wonder if there is anything else that FINDU could do to improve its service to Blind Hams... this could really open up another view of HAM radio to them.

I hate to suggest more things for FINDU to do (Steve is very busy already), but I wonder if a blind (text only) access page to FINDU might be useful? It might say:

```
WB4APR IS:                   0.6 miles northeast of ANNAPOLIS, MD
Moving:                      Northeast at 14 Miles per hour
Report was received:         6 days 45 minutes 39 seconds ago
The 4 nearest stations are:  W3XYZ, W4ABC,W9XYZ,W0ABC
Last message was:            ALmost home!
```

> over what constitutes an "emregecny" and thus impossible to get agreement
> on it...

I'm not sure that "bickering" is helpful ...

I went back to the PEAPRS test announcement web site to see what the designers of this test intended.

http://www.cq-amateur-radio.com/Air%20Force%20Labs.html

Which reads, in part:

"During these flights the aircraft will transmit a distress message using the call sign WA2ZXS."

Is it patently clear from what was transmitted during the test that this was a "distress" message?

Going back to the first days of radio, there has been an internationally recognized convention for "distress" calls. Why? So that there would not be any ambiguity. I believe that the current test, and its ancillary discussion, shows that there is ambiguity in the use of "EMERGENCY!".

This test has demonstrated to me that if I desired to send a distress message, I would not use the "EMERGENCY!" position comment alone. If I was going to use APRS at all (I would, but it would be an "auxiliary line of defense" as the PEAPRS web site indicated about the recent test) I would put the word "MAYDAY" in the Status text to eliminate all ambiguity. By doing that, it is clear to others that I am taking responsibility for a distress call.

Peace and 73,
Stephen

Why should everyone be in on the discussions? Because with side discussions, there isn't any reporting back to a group. I spend time every week emailing others directly to get information that they requested over the SIG that wasn't sent back over the SIG. It is a BIG waste of time. That is the point of having the listserv in the first place... so that everyone will be in on the discussions and you can get more input.

It is kind of like APRS... All the stations report to the group so you don't have to go hunting for the information. It is already there on your screen and you know if anything has transmitted!

EXACTLY!!  Except that this is the feature that needs SUPPORTED,
not taken out.  There are a LOT of 'side discussions' going on.  Why
should everybody always see everything?

Just like this!  I don't want to clutter the list with this
discussion
anymore.

But think about it...  Why should 'reply' go to the list and 'reply
all'
go to
the list plus the sender?  Isn't the sender part of the list and he
gets
it
anyway?  All reply all would do is to send it to the originator
twice,
with
no utility benefit to the person doing the reply, unless he just
wants to
double tap someone to make his point.

Doing it the way it does now offers the person sending the reply the
most utility.  And does it with no need to type or cut-and-paste into
any fields.  In fact, the only thing the person had to edit at all is
 if
he
does a 'reply all' and DOESN'T want that extra response to the
sender,
and then it's just a simple click and delete.  People will do that.
I do
that.

Mike

Then apparently something must be wrong with your mailer.

When I hit reply, it goes back to the LIST and to the sender just like one
would expect.  (I use PINE.)

Bob

Come on Bob! You are going to sit here and tell me the over 90% of the
users of email lists use Pine?
Give me a break.

Jim

Earlier this year, I changed the List options as some of you have suggested (REPLY to List; REPLY ALL to List and originator). As you may remember, the change was an unmitigated failure for a number of reasons, so I set the List options back to their previous (and current) settings.

I have no intentions of repeating that experiment again.

End of discussion.

APRSdos and APRStk have a built-in QSL mode for FielDay.
See FIELDAY.TXT included in all copies of APRSdos. It is also posted on:

http://web.usna.navy.mil/~bruninga/APRS-docs/FIELDDAY.TXT

But anyone may do it manually as well. Here is the best way to make the maximum 2-way QSO's with minimum QRM:

1) Set your POSITION Text to your FD report. (CQ FD, 1A-MD)
   (1A is station type and MD is our ARRL section)
2) Watch for other stations sending same
3) When you have accumulated several, send a single Bulletin

   TO: BLN#1A-MD MSG: QSL W1ABC,W2XYZ,N3APC,W4XYZ,N5ABC

4) As each new station appears, then ADD them to the SAME Bulletin above
   and delete the previous outgoing packet..

This way you ONLY have one outgoing packet on the air at a time, yet you are QSLing as many as 8 stations at a time... Thus for 8 stations to log 8 completed two way QSO's, you dont need 64 separate APRS messages on the air at once, but only 8. One from each of the 8 stations..

WHen you finish the first 8, then bump up the BLN# by 1 and keep going. Always kill the old outgoing BLNs to minimize QRM.

You may count as a valid QSO, any station that you have RECEIVED
and QSL'ed that has also then included YOU in his QSL bulletin...

No reason I need to do it. There are at least 4 people that have written programs which directly access findU's database, which has been open since the beginning, and documented several times on the sig.

The program uses standard mysql port, the user name is guest and there is no password, the database is aprs. This gives you read-only access to most of the tables, excluding only the user registration and private data tables.

The only rule is to be nice, it is quite possible to generate a query that takes days to complete, since there are many millions of records in the tables. One absolute rule is no joins...which combine data from two or more tables into a sincle select statement. If you were, for example to join two tables with 1000 records each, there are a million possibilities that need to be tested. Optimization makes properly phrased joins feasible, but it is pretty easy to see what an unoptimizable join between two tables with millions of records would be do to findU. There is nothing a join can do that cannot be done with a program querying tables sequentially.

All long queries (over 5 seconds) are logged along with the source, and if there begins to be a problem I'll have to eliminate the open access. Please, this is not the place to learn SQL. There are lots of good resources on the web, and it is easy to set up your own data files to experiment with, don't use the findU database unless you know what you are doing!

AGWPE?

If the laptop has a sound card, skip the TNC and use AGWPE on the parallel
port (for PTT control), leaving the serial port free for the GPS.

Or perhaps wire up an adapter that let's AGWPE and the GPS share the serial
port -- they use different pins (haven't heard of anyone doing this,
however, so I don't know if there might be a problem).

No, probably 2% or less....   But do you mean to tell me that you are
using an email program that cannot REPLY-TO-ALL?

That is what PINE does.  Two key strokes:  R for REPLY and Y for "yes,
to-all"..  I certainly am not suggesting others use ancient PINE, but
it seems that if the newer and fancier email programs cannot REPLY-TO-ALL,
then something is wrong...

Bob

But although it puts them both in the ADDRESS field, the TAPR email
program is smart enough to recongnize the DUPE, and only one of them goes
out to the list..

> >abbreviation is) port.

Many methods:
1) Use a Kenwood D7 or D700 or AlincoDJ-130? THey have a separte GPS port
   and will combine both the GPS and APRS into a single serial port stream

2) Use a momentary Push Button SPDT switch to select the GPS or TNC.
   Every time you want to update your position on the Laptorp and APRS,
   just press the button for 2 seconds. This is the ULTIMATE in "smart"
   beaconing.....(grin)

3) Use a GPS that you can set the OUTPUT rate to ONLY $GPRMC and only once
   every 30 seconds or so. Then DIODE-OR the GPS data to the TNC data
   into the single serial port.

4) Built the HSP adapter (a transistor and a few ressitors) that will
   automatically switch between the GPS and TNC...

See the usual APRSdos README\GPS.TXT

I guess you missed my meaning, it was that I don't need to do it.
Others have done different things, the port is open and it would be
easy to do, but no one has done this particular thing.

I bet even Bob could learn to do this!

450. [aprssig] APRS TOCALLs/versions (June 2002 2nd revision)

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 13 Jun 2002 11:20:48 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-84759-2002.06.13-10.57.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

THe copy from yesterday still did not have some of the feedback I had
received. Here is the LATEST copy that I hope includes everyone's
requests: It adds:

```
 APCY for the Cybiko
 APJA for JavAPRS
 APJE for JeAPRS
 APU3 for UIview terminal program
```

And it adds Xastir to the list under APX...

Here is the current list of APRS TOcalls and Version nomenclature that I
have updated.

```
 APA A-Filter, Alinco, etc
     APAFxx  AFilter.
     APAGxx  AGATE
     APAXxx  AFilterX.
     APAHxx  AHub
 APB avail
 APC Windows CE, etc
     APCYxx  Cybiko applications
 APD APRSd, etc
     APDTxx  APRStouch Tone (DTMF)
 APE avail
 APF avail
 APG Gates, etc
 APH HamHud, etc
 API Icom, etc
```

```
    APICQx for ICQ
APJ JavaAPRS,JeAPRS,etc
    APJAxx JavAPRS
    APJExx JeAPRS
APK Kenwood, etc
    APK0xx THD7's
    APK1xx D700's
APL Liunx applications
APM MacAPRS, etc
APN Network nodes, digis, etc
    APNDxx DIGI_NED
    APNUxx UIdigi
APO APRSpoint
APP pocketAPRS, etc
APQ avail
APR APR8xx APRSdos,etc
    APRDxx APRSdata, APRSdr
    APRKxx APRStk
    APRS   Generic, (obsolete. Digis should use APNxxx instead)
    APRXxx APRSmax
    APRTLM used my MIM's and Mic-lites, etc
APS APRS+SA, etc
APT TinyTrack
    APTTxx Tiny Track
    APT2xx Tiny Track II
    APTAxx K4ATM's tiny track
    APTV for ATV/APRN and SSTV applications
APU UIview, etc
    APU1xx UIview 16 bit applications
    APU2xx UIview 32 bit apps
    APU3xx UIview terminal program
APV avail
APW WinAPRS, etc
APX Xaprs, Xastir, etc
APY etc, Yeasu, etc
APZ Experimental
    APZ0xx Xastir
    APZPAD Smart Palm
```

Authors with similar alphabetic requirements are encouraged to share their address space with other software. Work out agreements amongst yourselves and keep me informed.

> Where can I find the Tripmate modification info?
>
> Thanks, Scott

As others have responded, you can see the mods.

However, be aware you can do everything needed without opening up the TripMate and breaking any seals, and keeping the unit stock.

Why bother on an out of warrantee unit? Resale for one. Compatibility for another.

Compatibility? Sure! Let's say you want to use it for an 'event'. A parade. But you need 2 or 3 units. You think anyone in their right

mind would loan you a unit to take apart and mod? Or, consider if
you had just your unit, but for one reason or another, it goes out of
service. You can take a borrowed unit, plug it in and use it. Not
so if you depend on 'hardware modified' units.

Mike

For whatever reason when I click on MS OE' reply all button places aprssigs
email address in both the to and CC fields. Due to cognative deficits
brought on by CVA damage brain I failed to notice and delete the CC entry.
I apologize but this not the first time this has happened and most likely
will not be the last however, I consider this to be one of life's small
stuff and I don't sweat it.--73

If you can find a used commercial HT in good condition for the right price
and with removing the battery pack you would have a compact and rugged
unit.--73
